

Influence of Edge Preparation on the Performance of Coated Cutting Tools

Invited talk of T. Cselle
at ICMCTF, San Diego, 25th of April, 2007

C. Buechel, O. Coddet, C. Galamand, P. Karvankova, D. Klostermann, A. Luemkemann, M. Morstein, A. Moschko,, J. Prochazka,, PLATIT, Grenchen, Switzerland
F. Barthelmae, P. Preiss, S. Reich,, GFE, Schmalkalden, Germany, M. Ruzicka, PIVOT, M. Sima, SHM, Sumperk, Czech Republic
T. Cselle, PLATIT, Grenchen, Switzerland

Influence of Edge Preparation on the Performance of Coated Cutting Tools

OUTLINE

APPLICATIONS

- Drilling
- Milling
- Turning
- Tapping
- Sawing

WHY EDGE PREPARATION?

- Form
- Surface
- Cutting material

Goal of edge preparation:
increase

**CUTTING
PERFORMANCE**

TREATMENTS

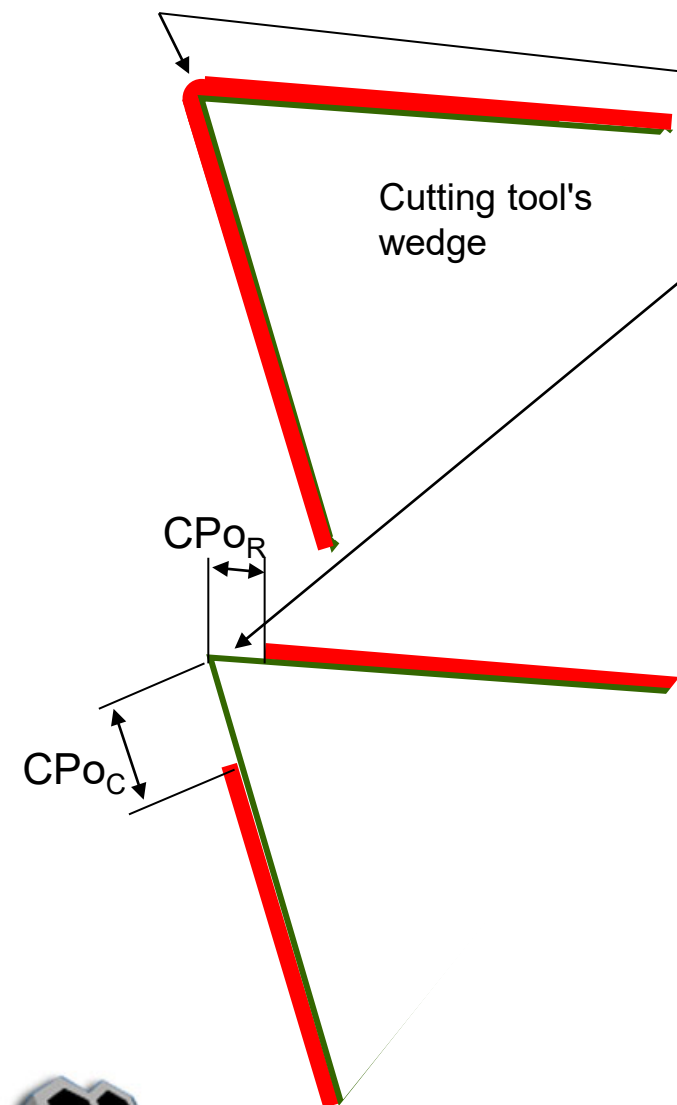

- Grinding
- Brushing
- Micro Blasting
 - Dry
 - Wet
- Drag Grinding
- Magnet Finishing

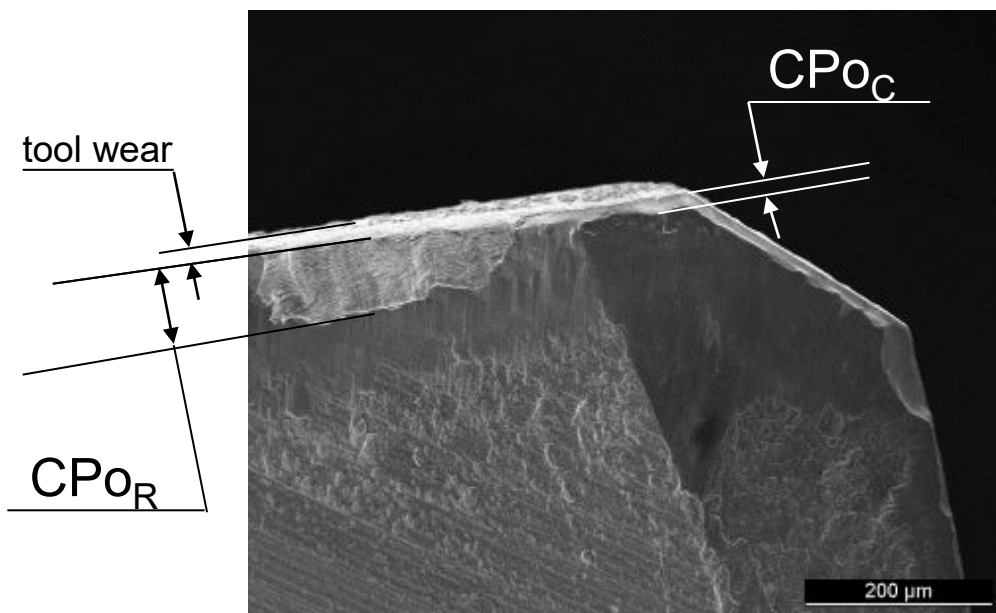

Influence of Edge Preparation on the Performance of Coated Tools

The AIM of Edge Preparation:

1. Directly on sharp edge the PVD coating has a very high internal stress
2. Because of this very high internal stress the coating breaks away, peels off very shortly after starting cutting
3. The tool's wear is always measured on the surface of the cutting material where the coating isn't present anymore.
4. The goodness, the quality of a coating is strongly determined by the ABILITY of the coating TO KEEP THE GROWTH OF DISTANCES CPo_R and CPo_C SLOW during the cutting process, along the tool life
 CPo_R : coating's peeling off on the tool's rake surface
 CPo_C : coating's peeling off on the tool's clearance surface
5. The aim of a good edge preparation is;
 - to "ensharp" the cutting edges
 - to make a smooth transition of the coating possible between the tool's rake and clearance surfaces and with this
 - to reduce the internal stress of the coating
 - but without making the tool blunt

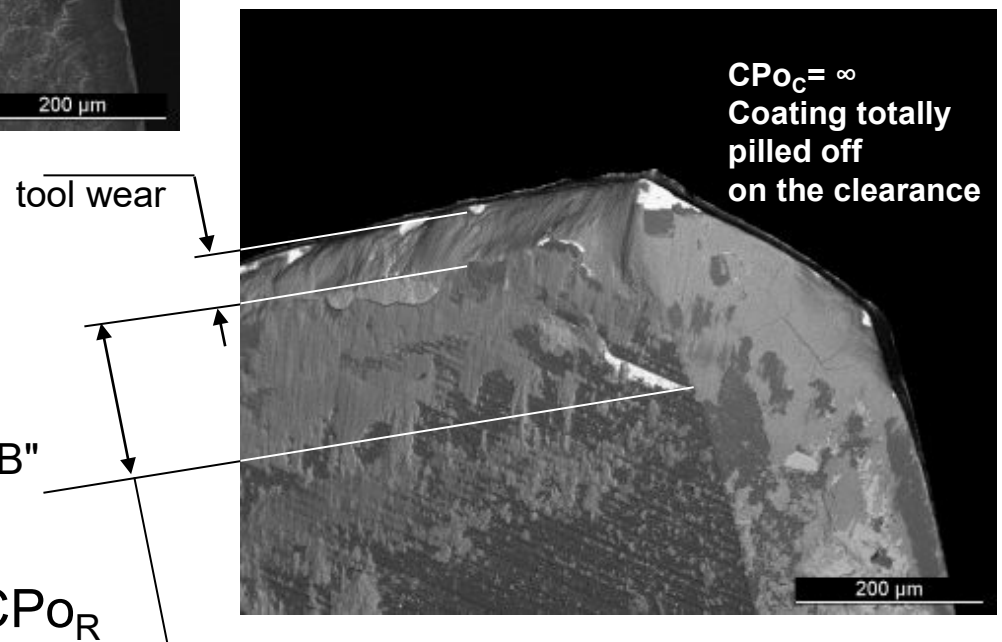

Influence of Edge Preparation on the Performance of Coated Tools

Coating's pilling off and tool wear
on the end mill with edge preparation "A"
after 40 m cutting distance

Coating's pilling off and tool wear
on the end mill with edge preparation "B"
after 40 m cutting distance

WHY Edge Preparation?

Target : EDGE STABILITY

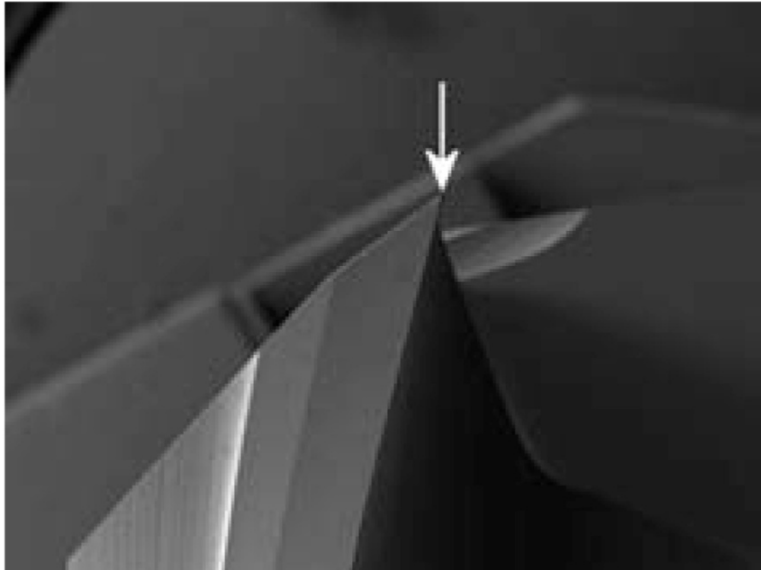

- **Form;**
 - (low) chipping

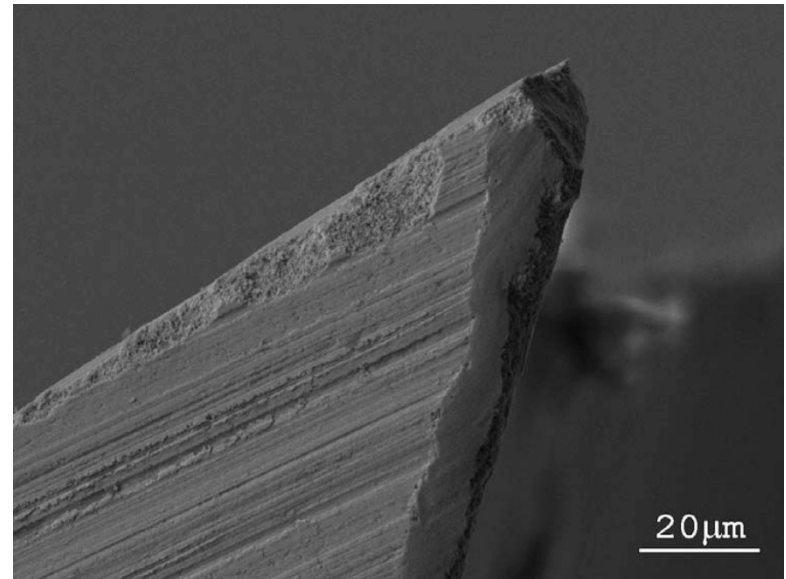

WHY Edge Preparation?

Tool Edge Images from High End Tool Manufacturers after Grinding

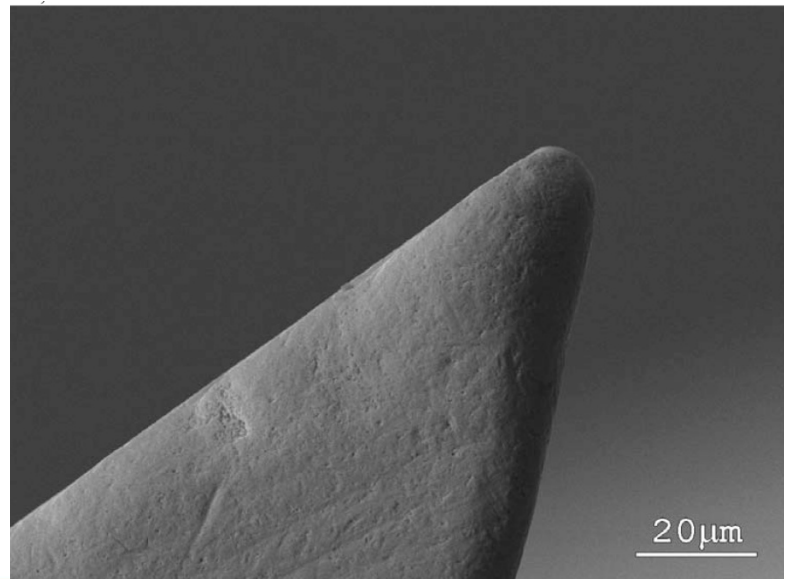

End Mill Corner:

After grinding

After edge preparation

WHY Edge Preparation?

Target : EDGE PREPARATION

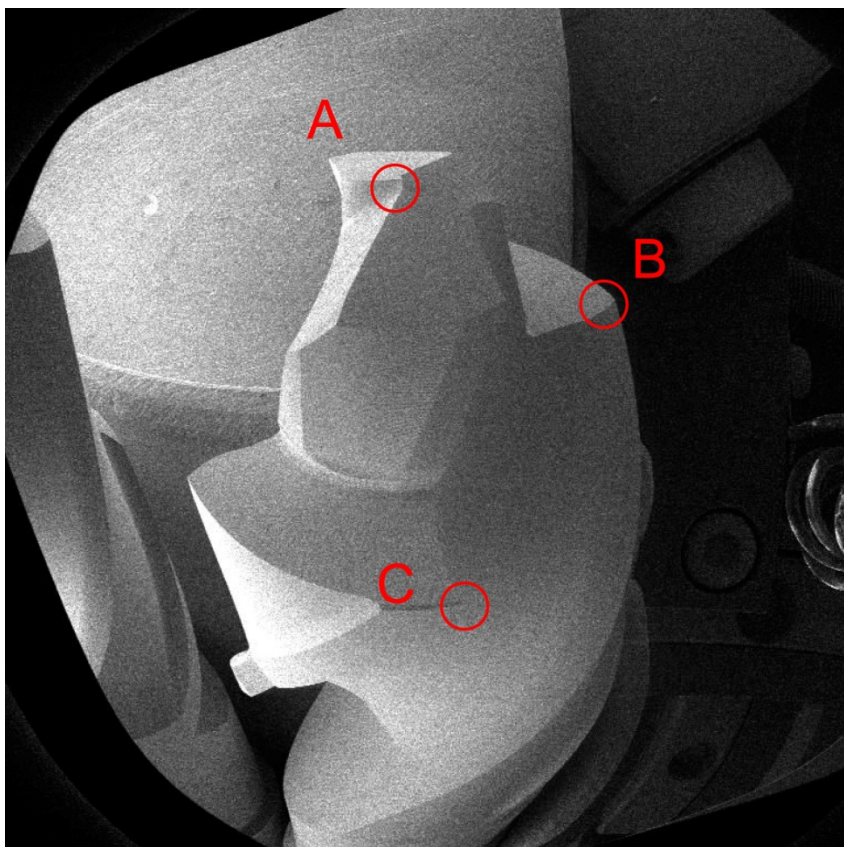

- Form;
 - (low) chipping
- **Surface;**
 - (low) roughness

WHY Edge Preparation?

Tool Edge Images from High End Tool Manufacturers after Grinding

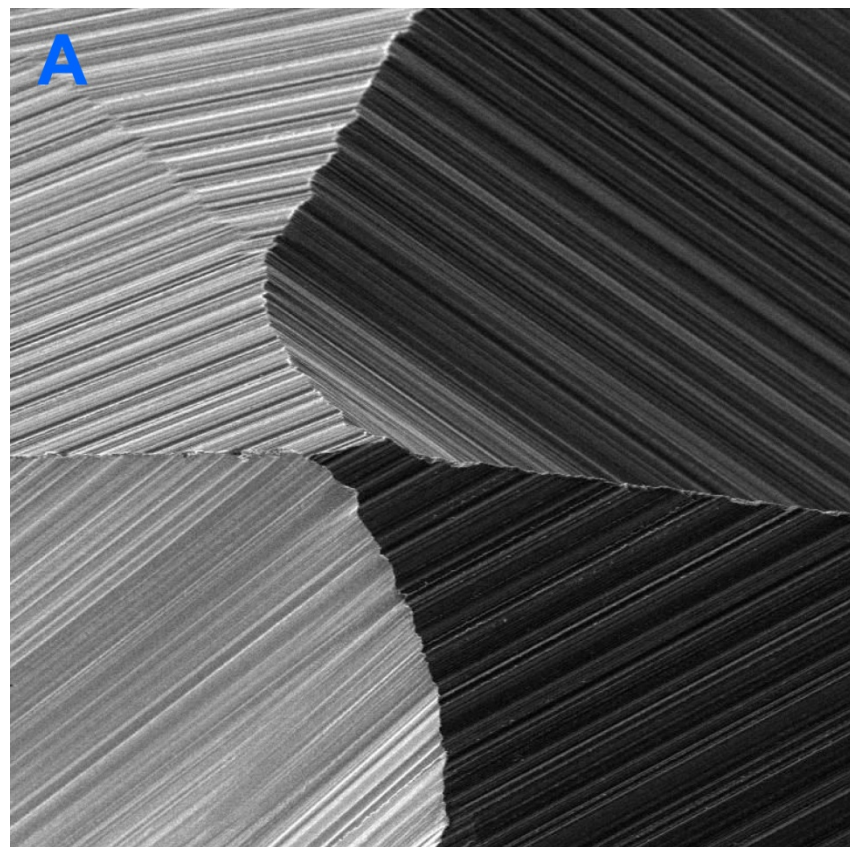

Carbide Drill:

SEM MAG: ---
HV: 20.00 kV

Digital Microscopy Imaging

WHY Edge Preparation?

Target : EDGE PREPARATION

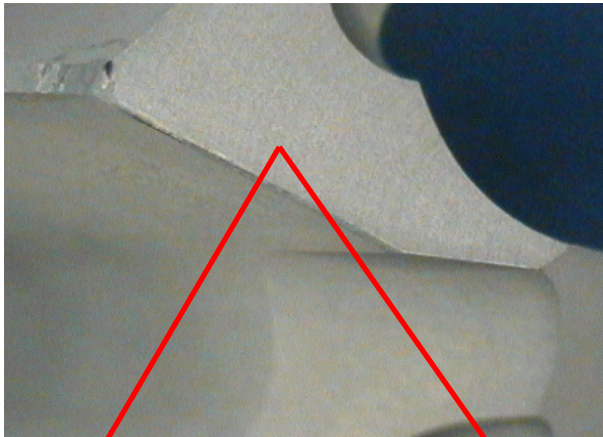

- Form;
 - (low) chipping
- Surface;
 - (low) roughness
- **Cutting Material;**
 - **(correct) composition**

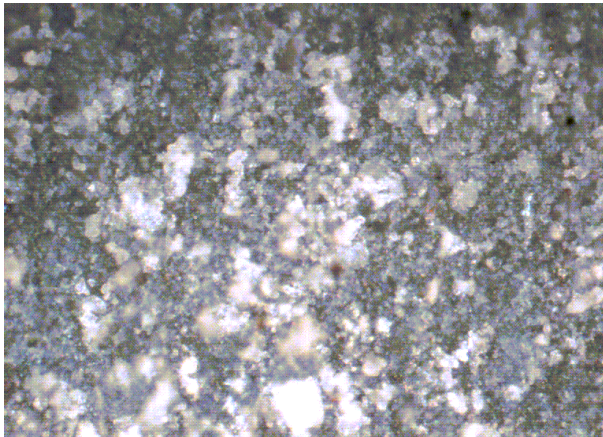

WHY Edge Preparation?

Tool Surface Images from High End Tool Manufacturers

Carbide Drill:

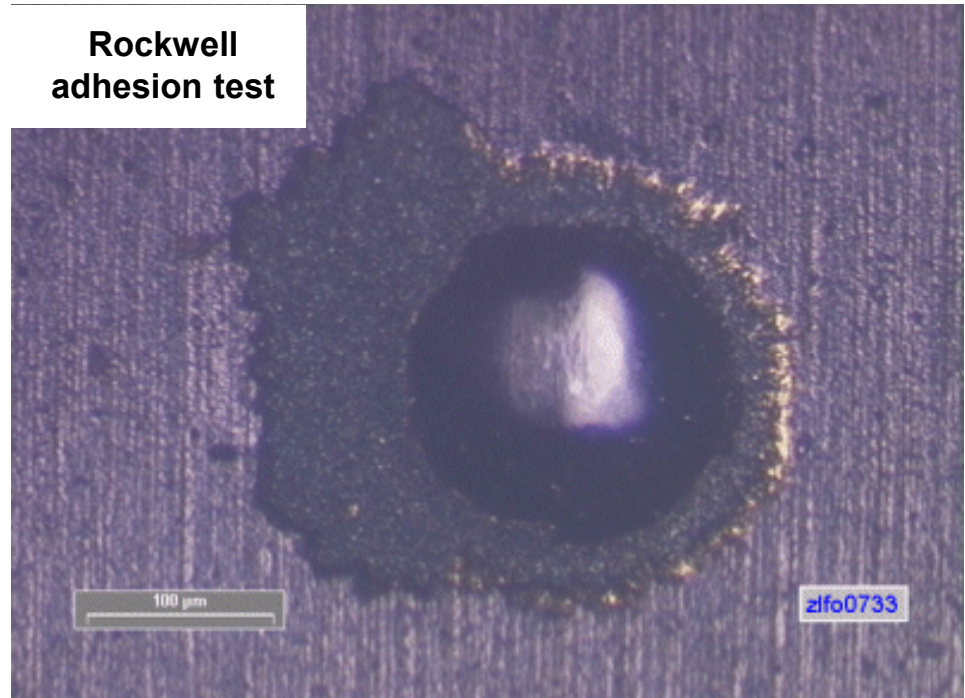

500x

Cobalt leaching

Rockwell
adhesion test

Coating on cobalt leached surface
-> coating on WC layer without/with few binder (cobalt)
-> very bad adhesion

Influence of Corner Edge Preparation on the Performance of Coated **Drills**

APPLICATION 1

- **Drilling**
- Milling
- Turning
- Tapping
- Sawing

Target : **EDGE
STABILITY**

- **Form**
- Surface
- Metallurgy

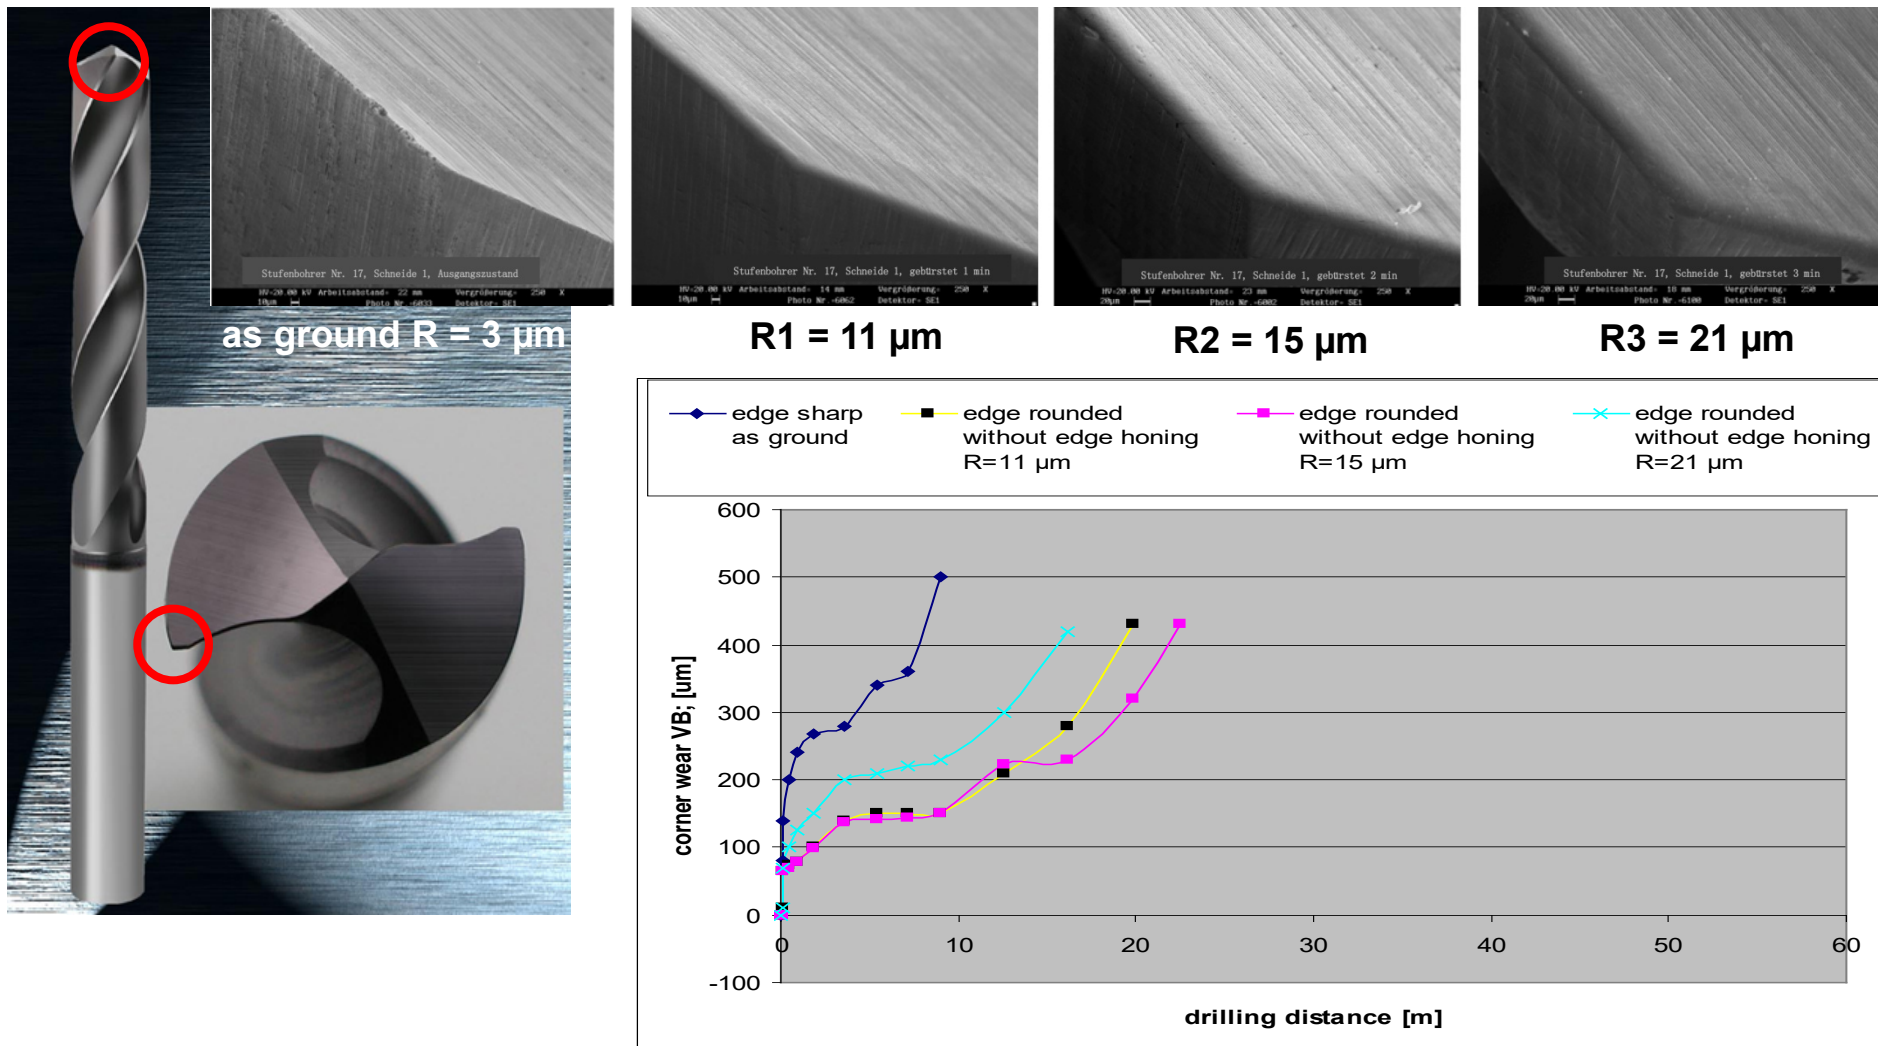

TREATMENTS

- **Grinding**
- **Brushing**
- Micro blasting
 - Dry
 - Wet
- Drag grinding
- Magnet finishing

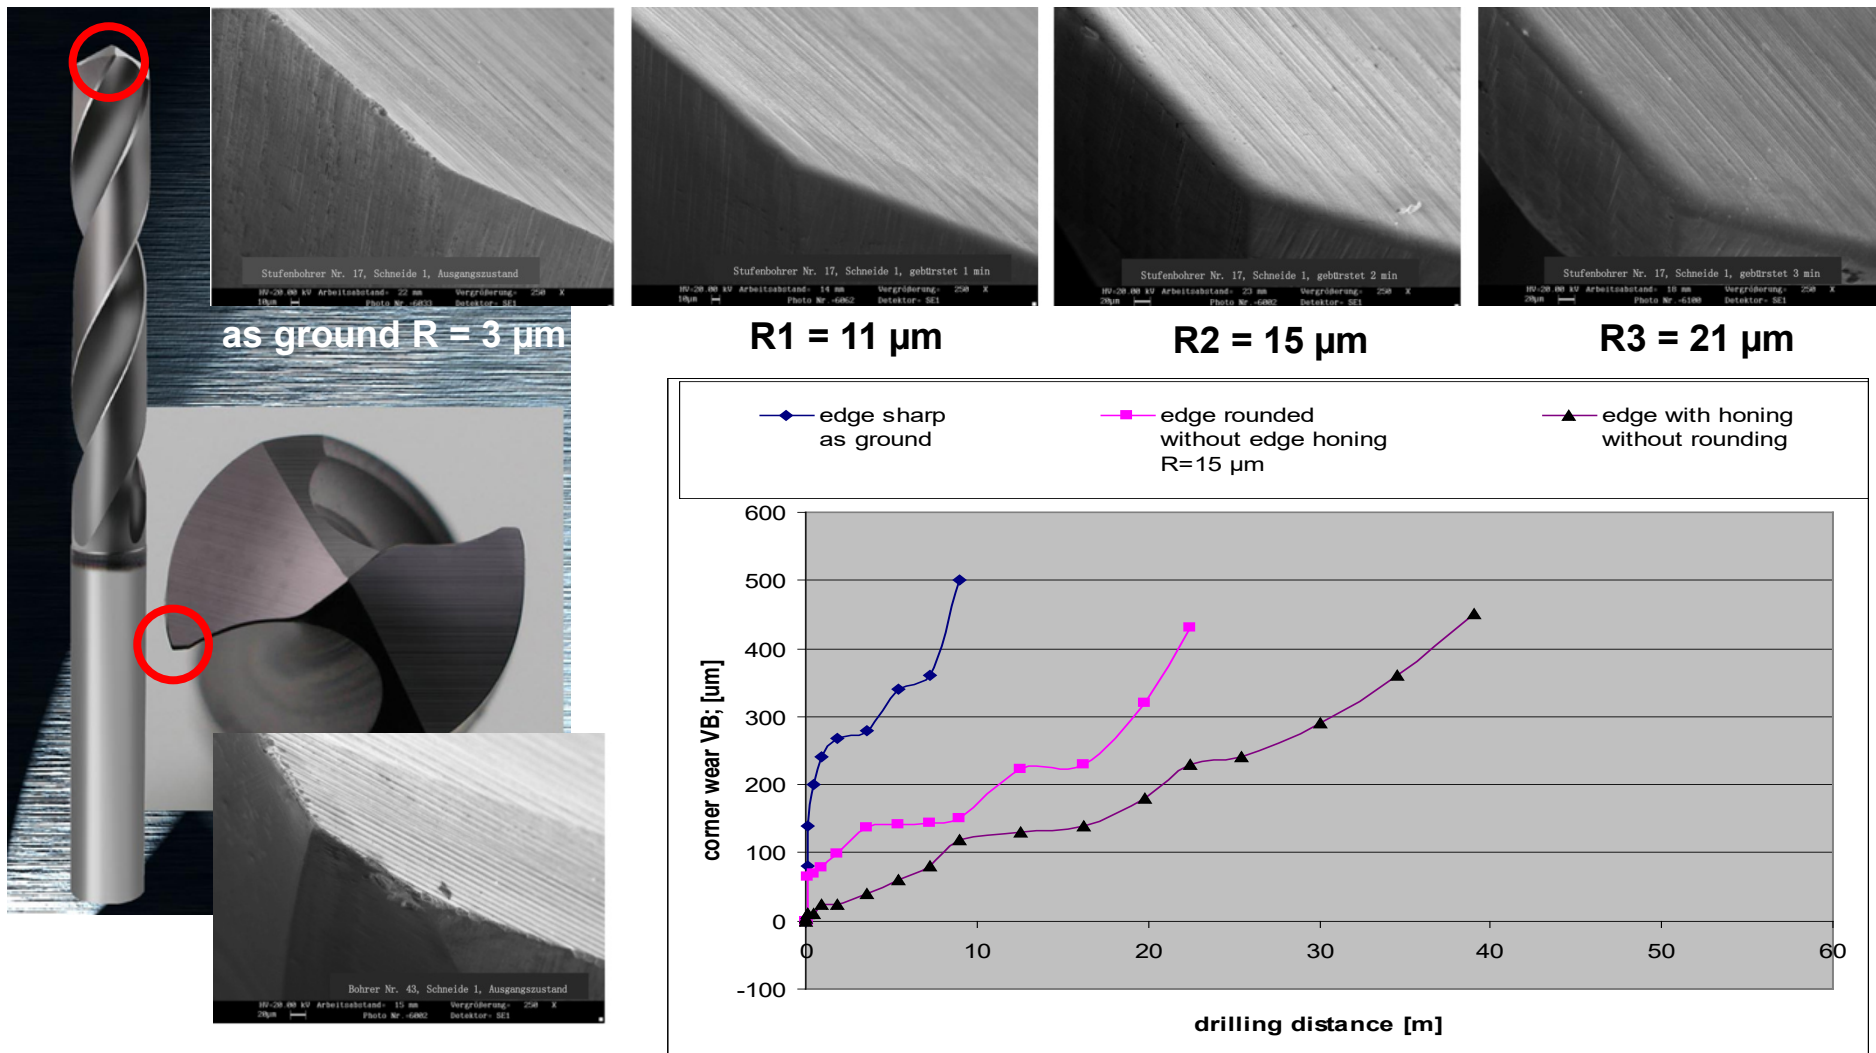

Influence of Corner Edge Preparation on the Performance of Coated Drills

Work piece material: cold working steel - 1.2379 - X155CrVMo12-1 – HRC22 - blind holes
Solid carbide drills with nACo coating: d=5 mm, vc=75 mm/min – fz=0.15 mm/z – ap=15mm – dry air coolant

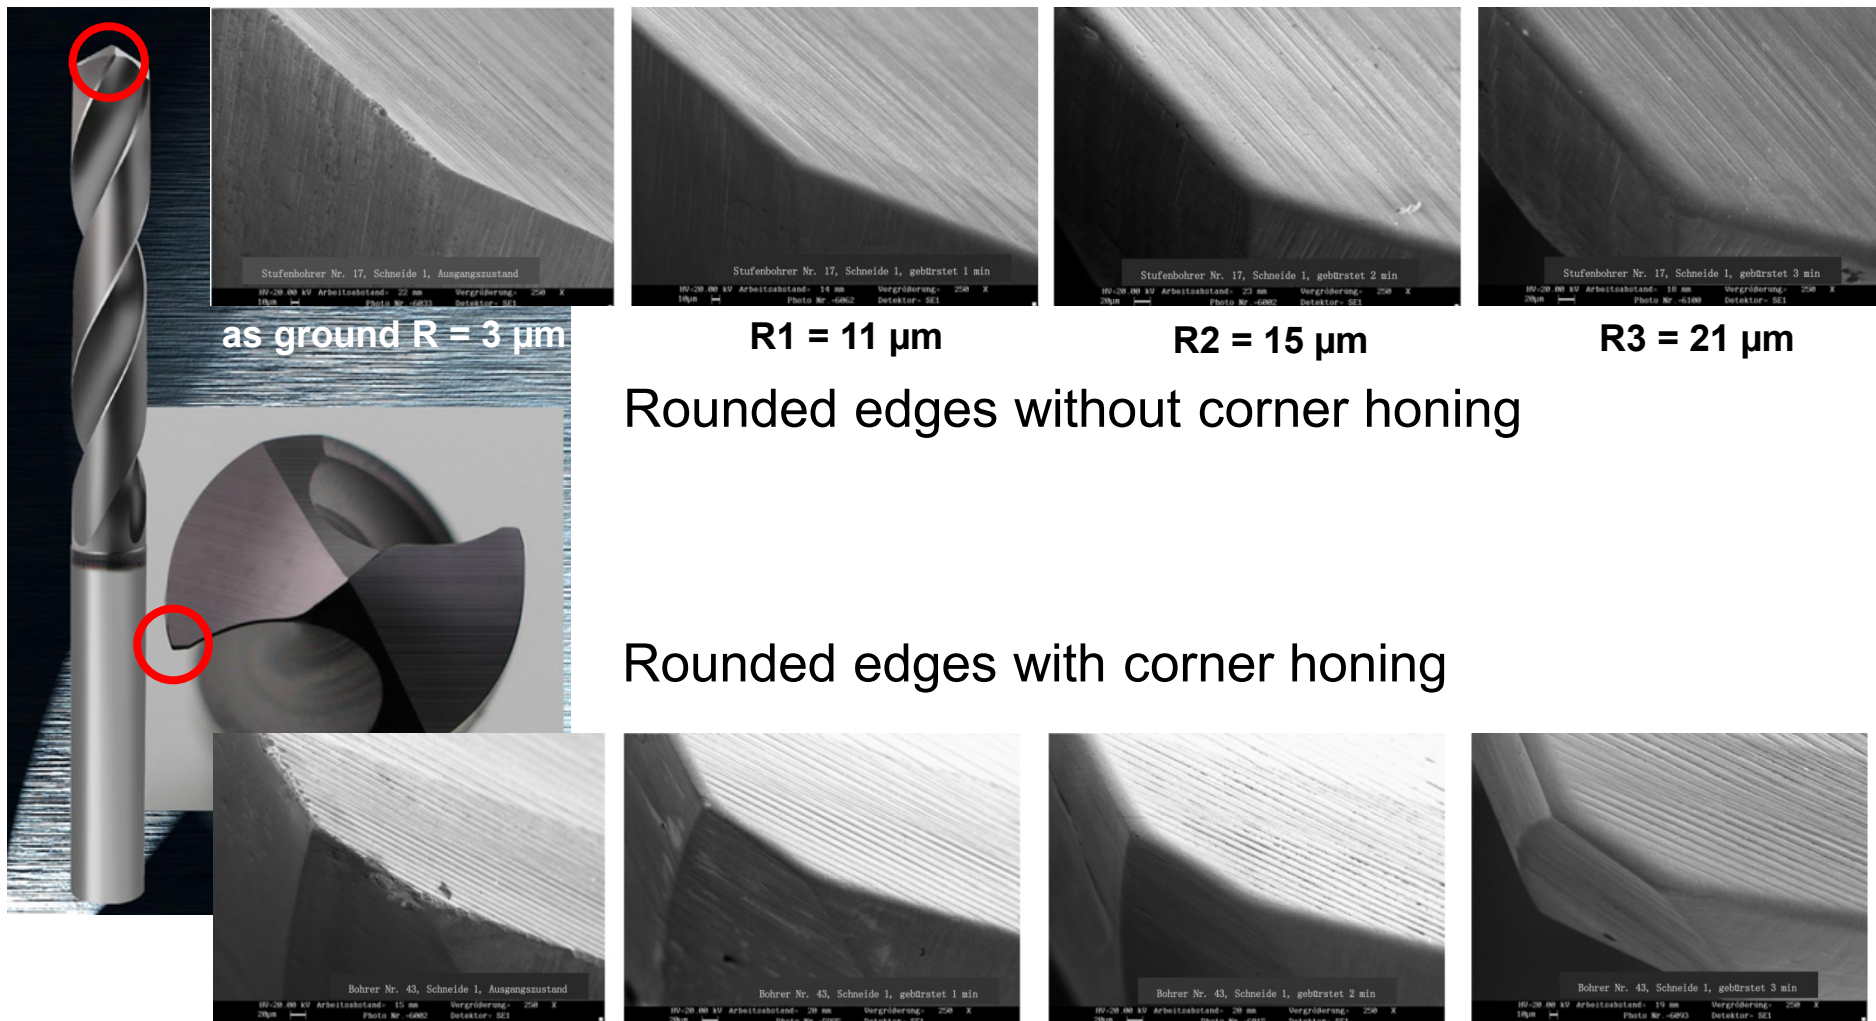

Influence of Corner Edge Preparation on the Performance of Coated Drills

Work piece material: cold working steel - 1.2379 - X155CrVMo12-1 – HRC22 - blind holes
Solid carbide drills with nACo coating: d=5 mm, vc=75 mm/min – fz=0.15 mm/z – ap=15mm – dry air coolant

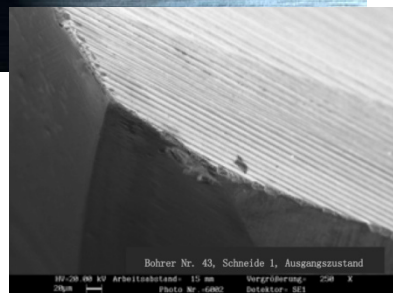

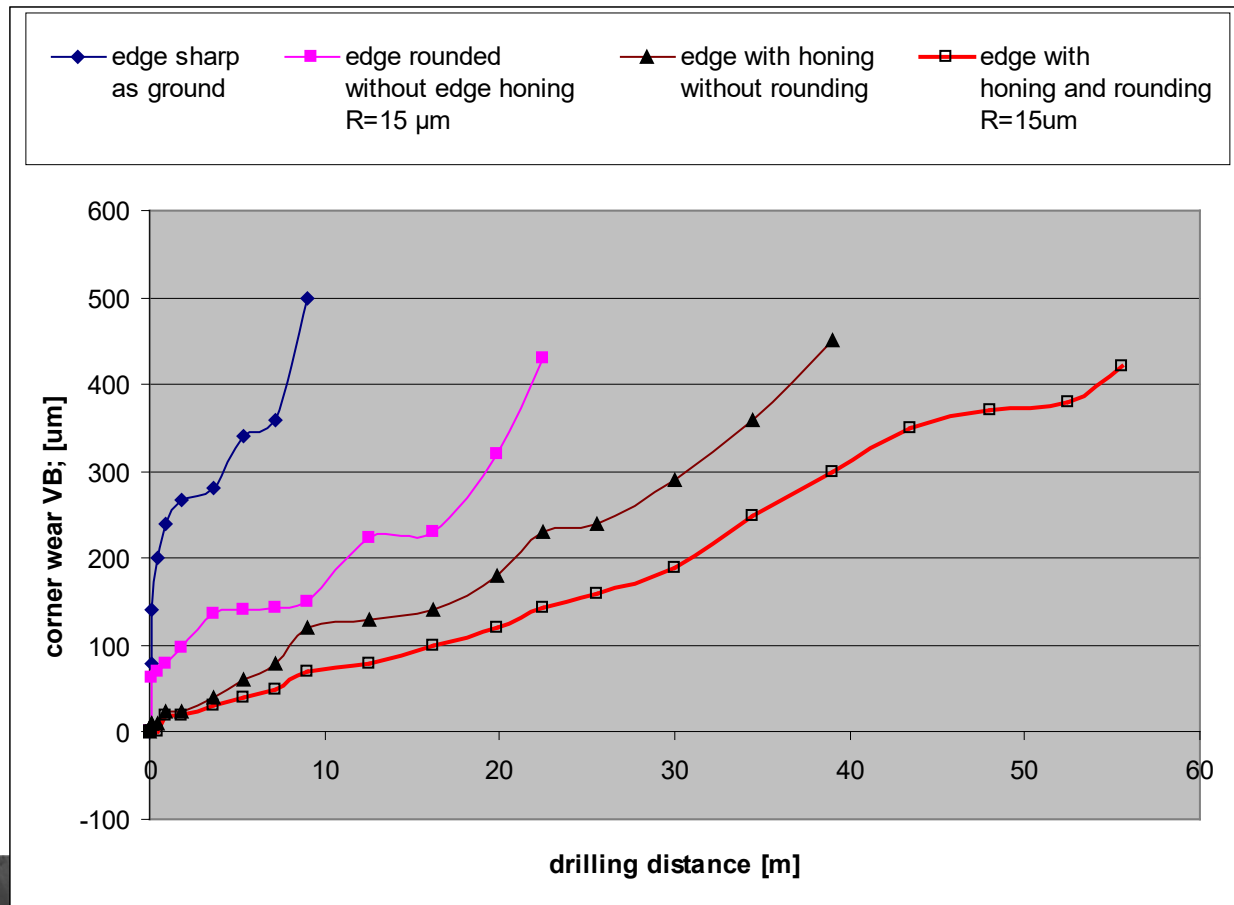

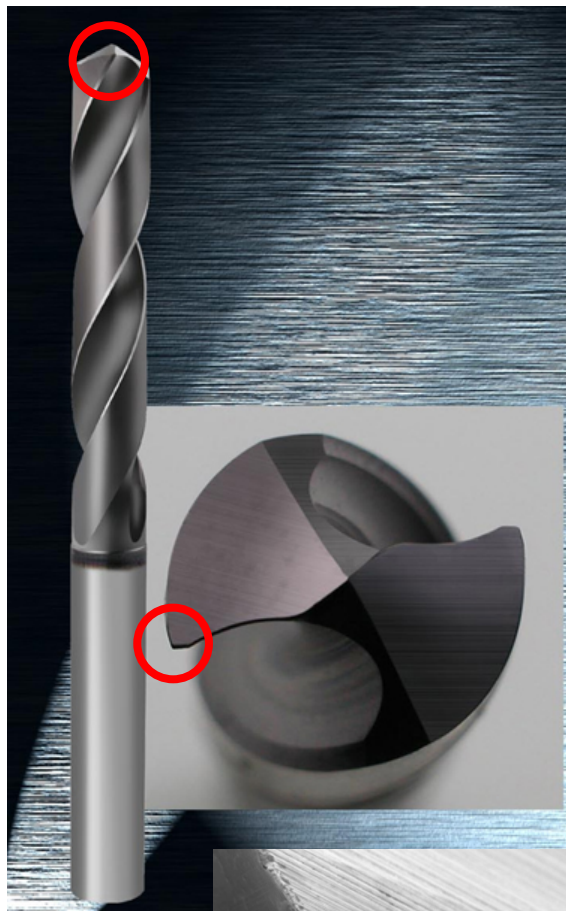

Influence of Corner Edge Preparation on the Performance of Coated Drills

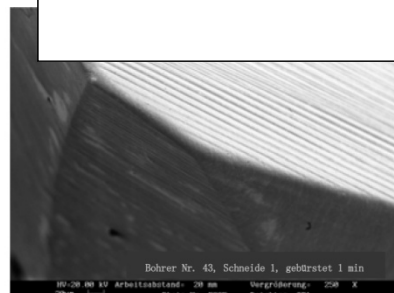

Work piece material: cold working steel - 1.2379 - X155CrVMo12-1 – HRC22 - blind holes
Solid carbide drills with nACo coating: $d=5 \text{ mm}$, $vc=75 \text{ mm/min}$ – $fz=0.15 \text{ mm/z}$ – $ap=15 \text{ mm}$ – dry air coolant

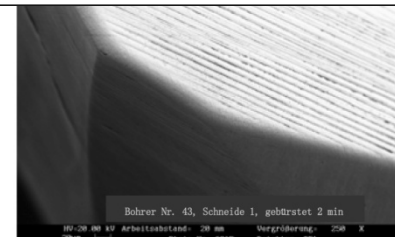

Influence of Corner Edge Preparation on the Performance of Drills

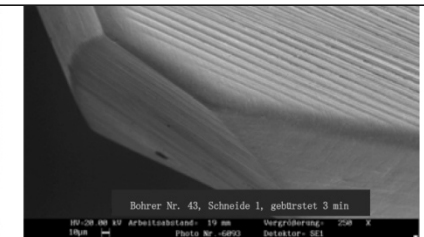

as ground R = 3 µm

R1 = 11 µm

R2 = 15 µm

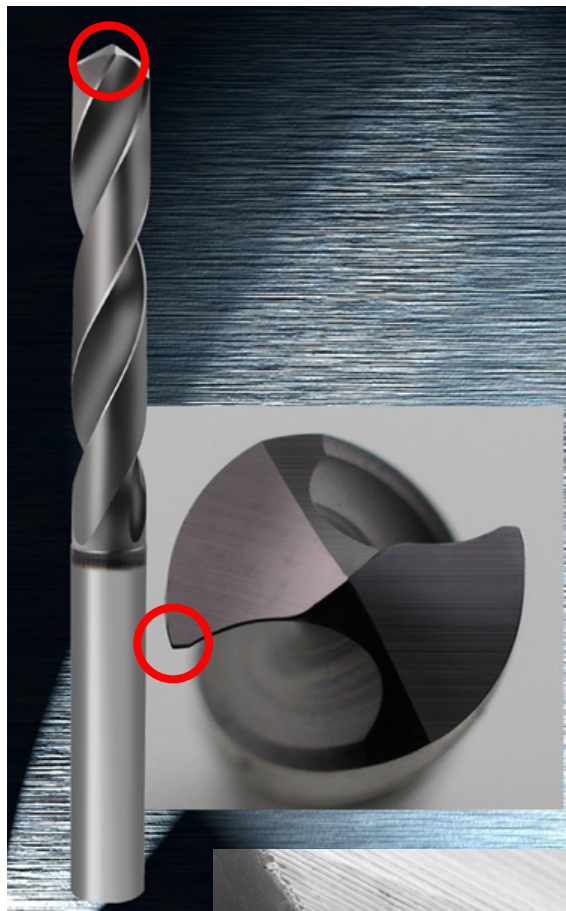

R3 = 21 µm

Influence of Corner Edge Preparation on the Performance of Drills

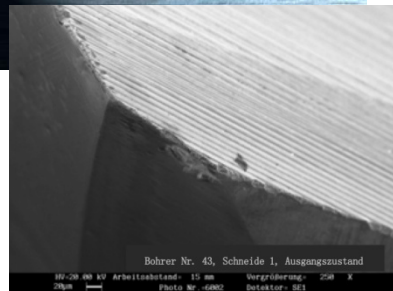

Edge brushing of included driven tools

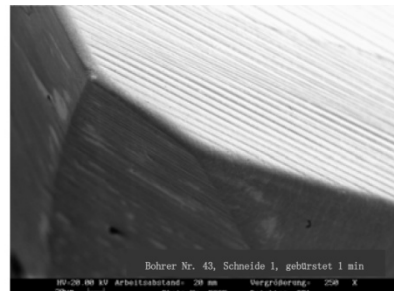

T1 = 1 min

T2 = 2 min

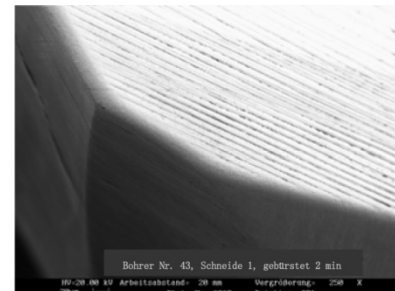

T3 = 3 min

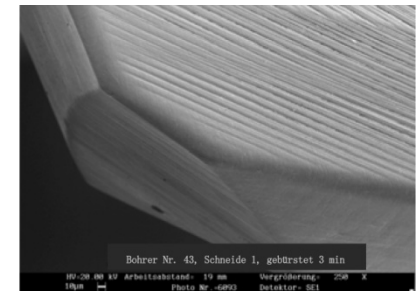

as ground $R = 3 \mu\text{m}$

R1 = $11 \mu\text{m}$

R2 = $15 \mu\text{m}$

R3 = $21 \mu\text{m}$

Influence of Edge Preparation on the Performance of Coated **End Mills**

APPLICATION 2

- Drilling
- **Milling**
- Turning
- Tapping
- Sawing

Target : **EDGE STABILITY**

- **Form**
- Surface
- Cutting material

TREATMENTS

- **Grinding**
- **Brushing**
- Micro blasting
 - Dry
 - Wet
- Drag grinding
- Magnet finishing

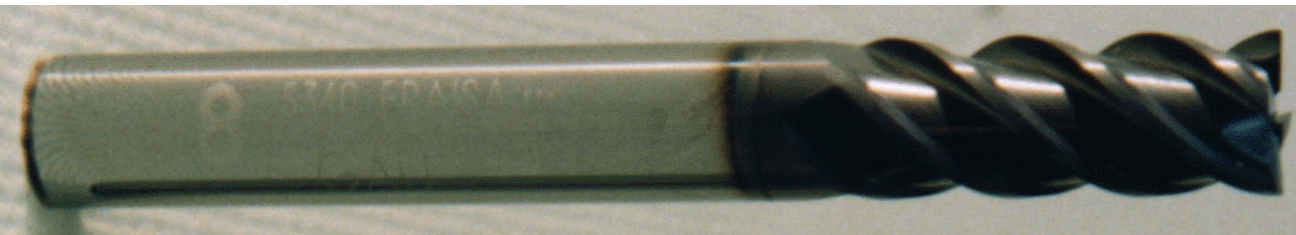

Influence of the Edge Preparation on Tool Life at Standard **End Mills** in Easy to Cut **HEAT TREATED** Steel

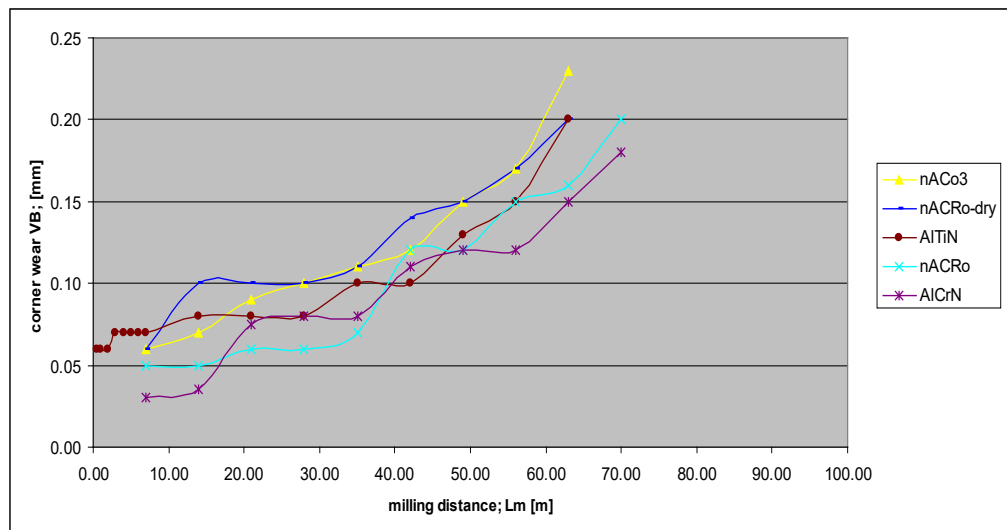

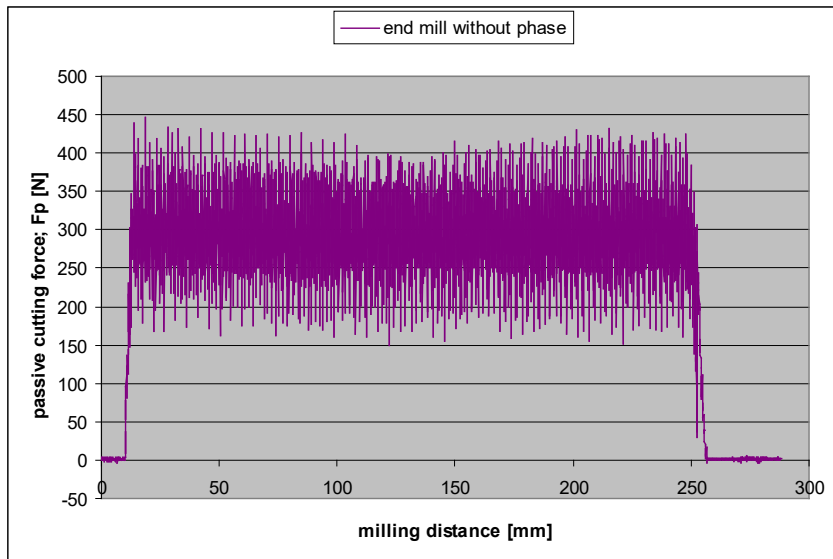

Material: 1.7225 – 42CrMo4 – 4140H – coolant; dry air
End mill: AlTiN coated - d=10mm, z=4, ae=1 mm – ap=d – vc=140 m/min – fz=0.1 mm/z

Influence of Edge Preparation on the Performance of Coated End Mills

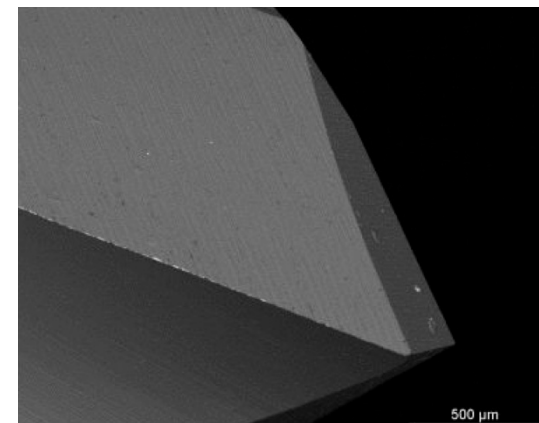

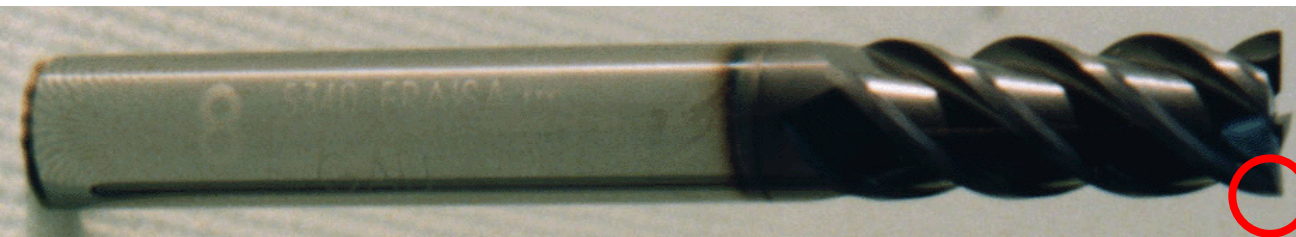

No tool life difference
for different coatings
because of instable
chattering during milling process

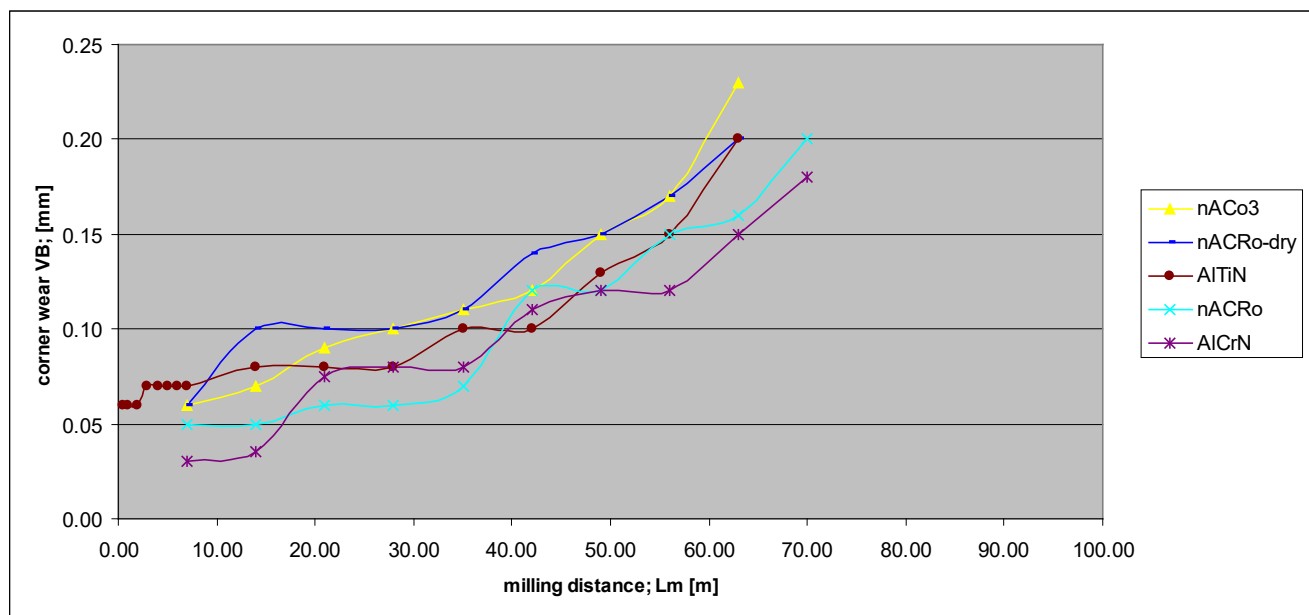

Work piece material: cold working steel - 1.2312 - 40CrMnMoS8-6 – heat treated - $R_m=1000$ N/mm² - HRC32
HM end mills: $d=12$ mm - $z=4$ - $vc=200$ mm/min – $fz=0.1$ mm/z – $ae=ap=6$ mm – down cut– coolant: dry air 6 bar

Influence of Edge Preparation on the Performance of Coated End Mills

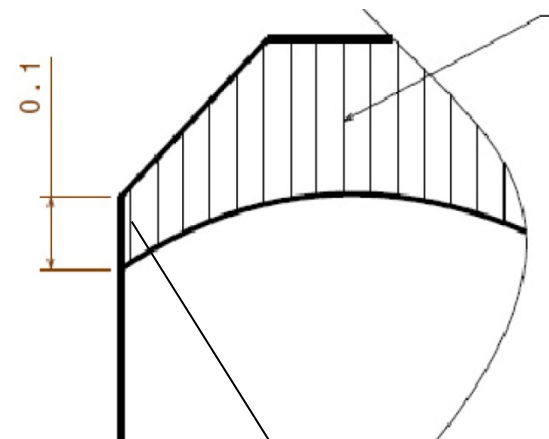

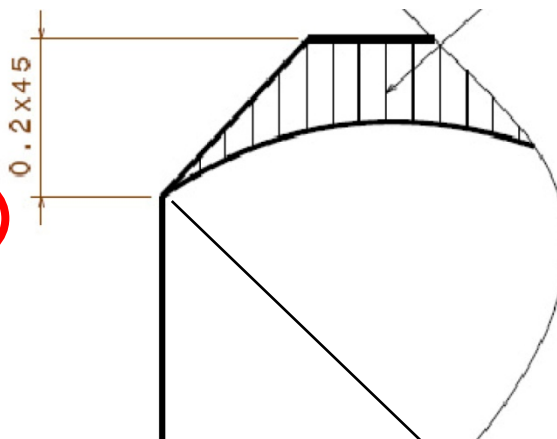

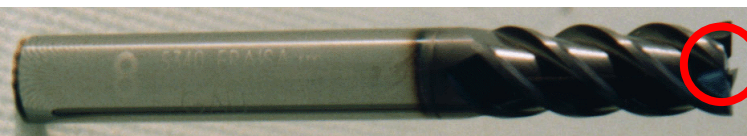

Max. Wear is always at the corner
as chipping, break out

Work piece material: cold working steel - 1.2312 - 40CrMnMoS8-6 – heat treated - $R_m=1000 \text{ N/mm}^2$ - HRC32
 HM end mills: $d=12\text{mm}$ - $z=4$ - $vc=200 \text{ mm/min}$ – $fz=0.1 \text{ mm/z}$ – $ae=ap=6\text{mm}$ – down cut– coolant: dry air 6 bar

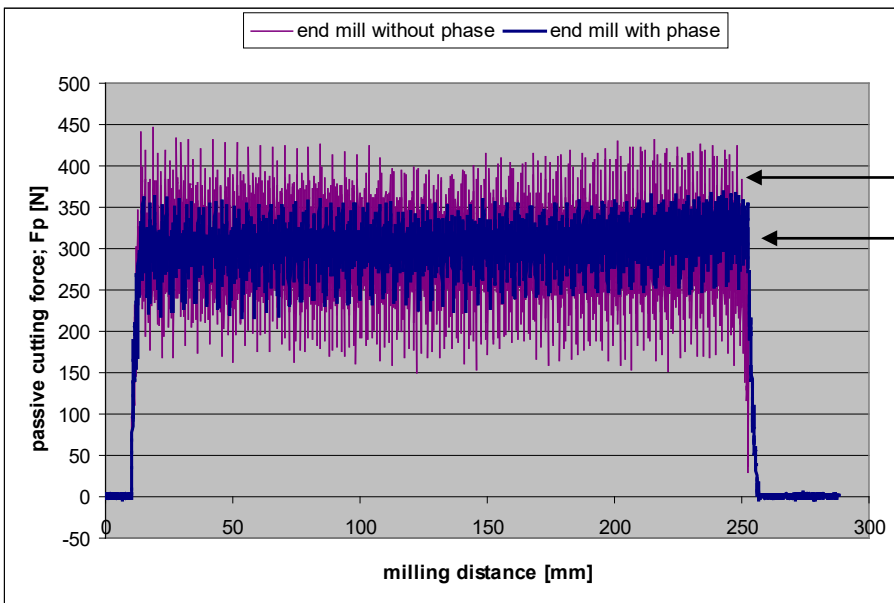

Influence of Edge Preparation on the Performance of Coated End Mills

The sharp, weak edge causes chatter

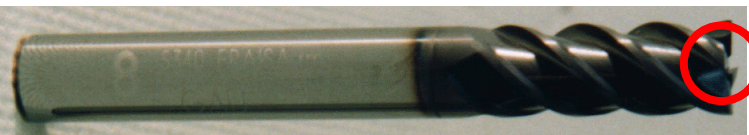

The honed, stable edge reduces chatter

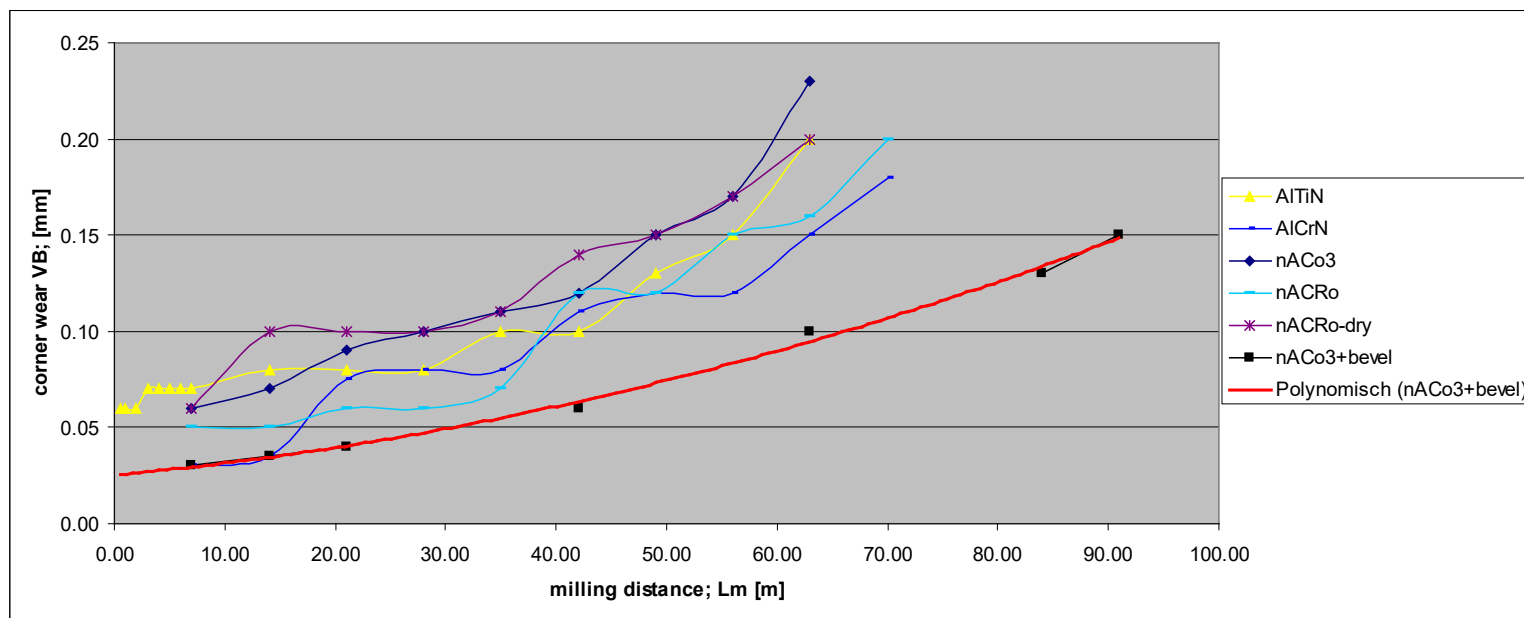

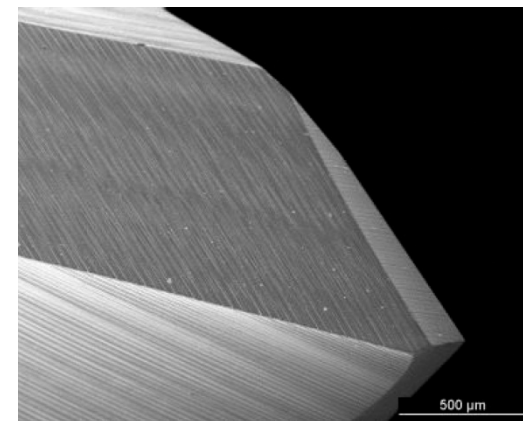

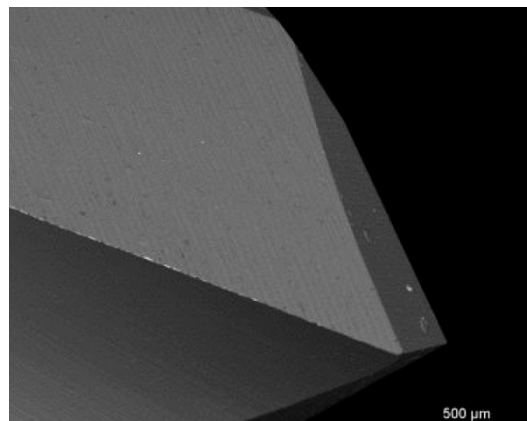

Work piece material: cold working steel - 1.2312 - 40CrMnMoS8-6 – heat treated - $R_m=1000$ N/mm² - HRC32
 HM end mills: $d=12$ mm - $z=4$ - $vc=200$ mm/min – $fz=0.1$ mm/z – $ae=ap=6$ mm – down cut– coolant: dry air 6 bar

Influence of Edge Preparation on the Performance of Coated End Mills

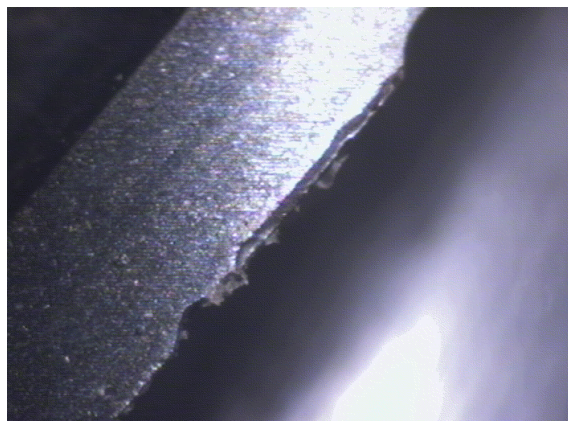

The edge bevel increases
tool life by 80%

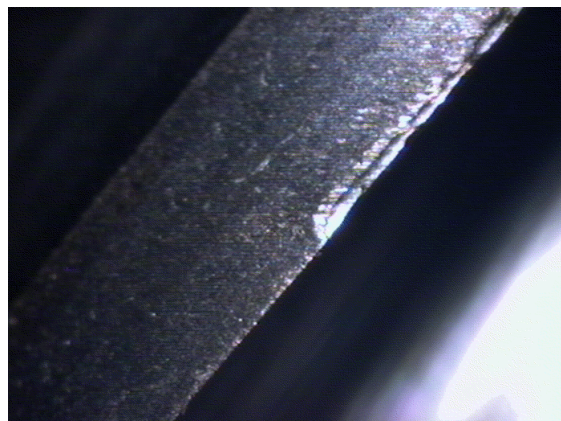

Work piece material: cold working steel - 1.2312 - 40CrMnMoS8-6 – heat treated - $R_m=1000 \text{ N/mm}^2$ - HRC32
 HM end mills: $d=12\text{mm}$ - $z=4$ - $vc=200 \text{ mm/min}$ – $fz=0.1 \text{ mm/z}$ – $ae=ap=6\text{mm}$ – down cut– coolant: dry air 6 bar

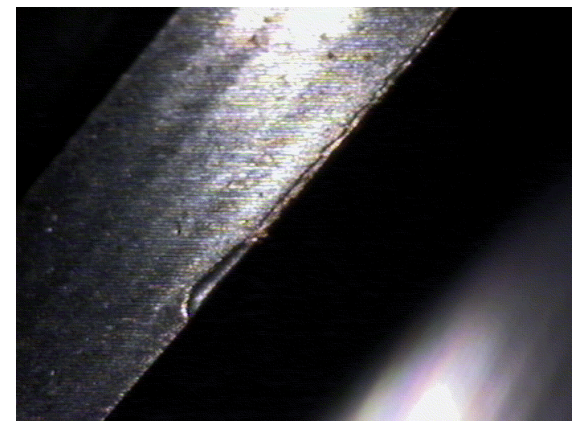

Influence of the Edge Preparation on Margin Wear after $L_m=60m$ at Standard End Mill in **HEAT TREATED** Steel

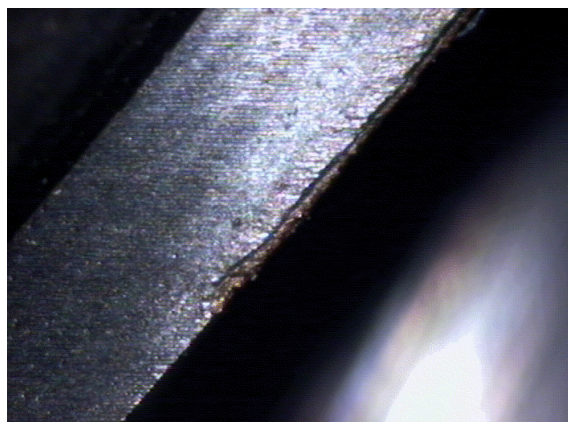

(NO) Honing = 0 um

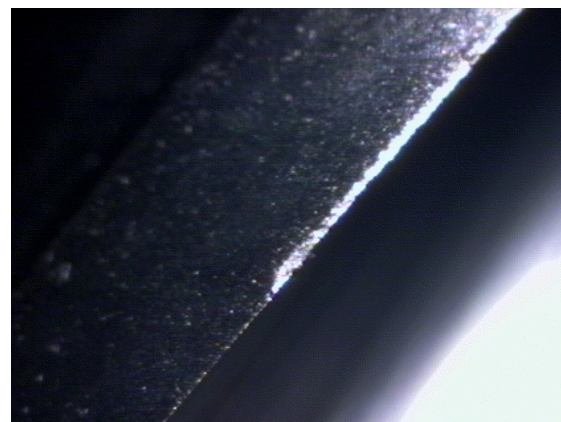

Honing = 10 um

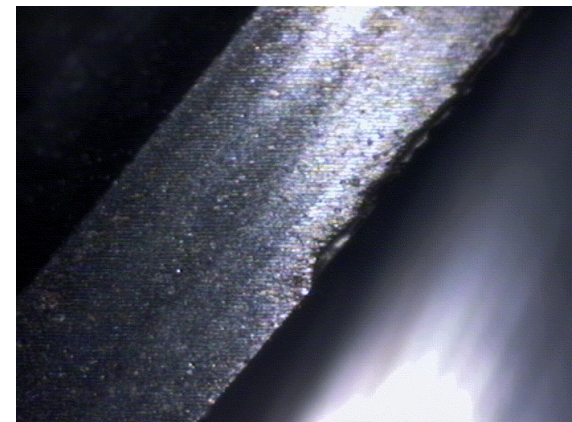

Honing = 15 um

Honing = 20 um

Honing = 30 um

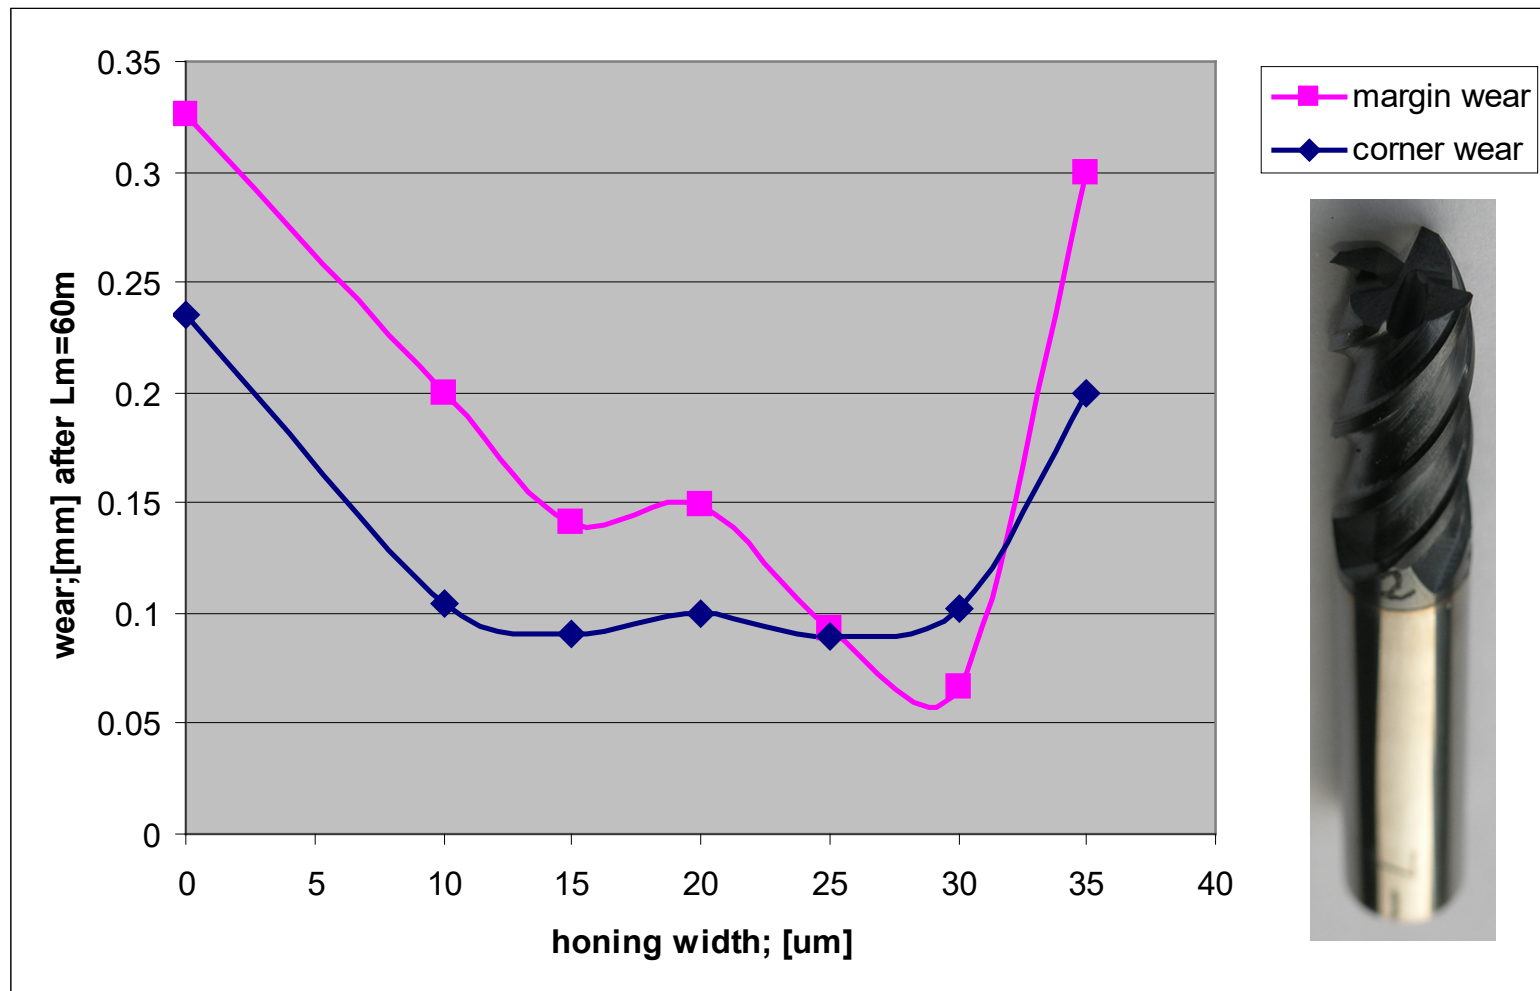

Honing = 40 um

Material: 1.7225 – 42CrMo4 – 4140H – coolant; dry air
End mill: AlTiN coated - d=10mm, z=4, ae=1 mm – ap=d – vc=140 m/min – fz=0.1 mm/z

Influence of the Edge Preparation on Tool Life at Standard End Mill in **HEAT TREATED** Steel

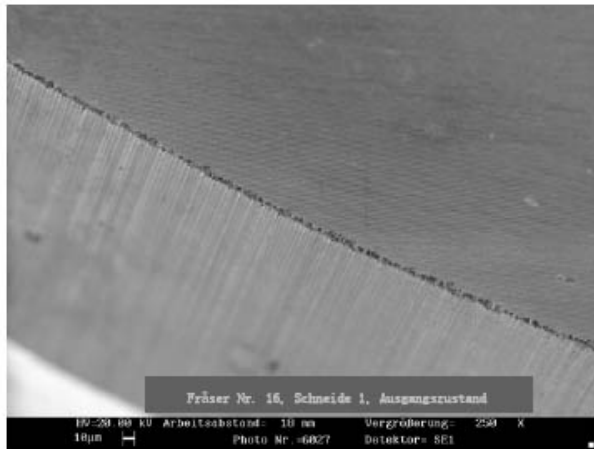

Material: 1.7225 – 42CrMo4 – 4140H – coolant; dry air
End mill: AlTiN coated - $d=10mm$, $z=4$, $a_e=1 mm$ – $a_p=d$ – $v_c=140 m/min$ – $f_z=0.1 mm/z$

Edge Preparation for High Performance Torus End Mill

After grinding

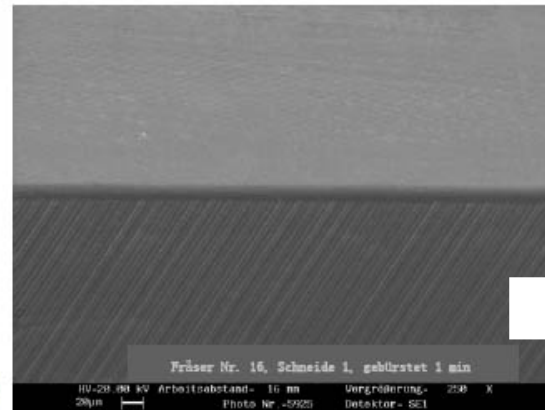

Umfangsschneide

$$r_n = 7 \mu\text{m}$$

$$R_t = 4,5 \mu\text{m}$$

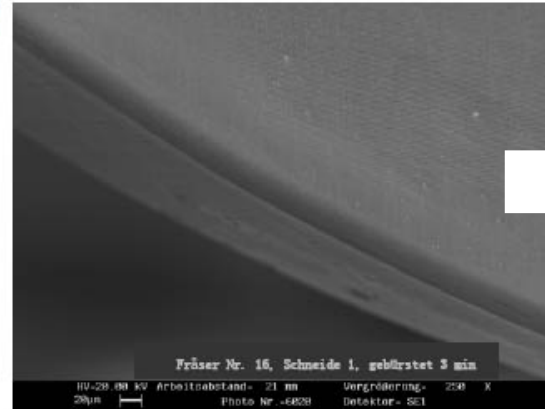

After edge prep

$t_B = : 1 \text{ min}:$

$$r_n = 17 \mu\text{m}$$

$$R_t = 3,3 \mu\text{m}$$

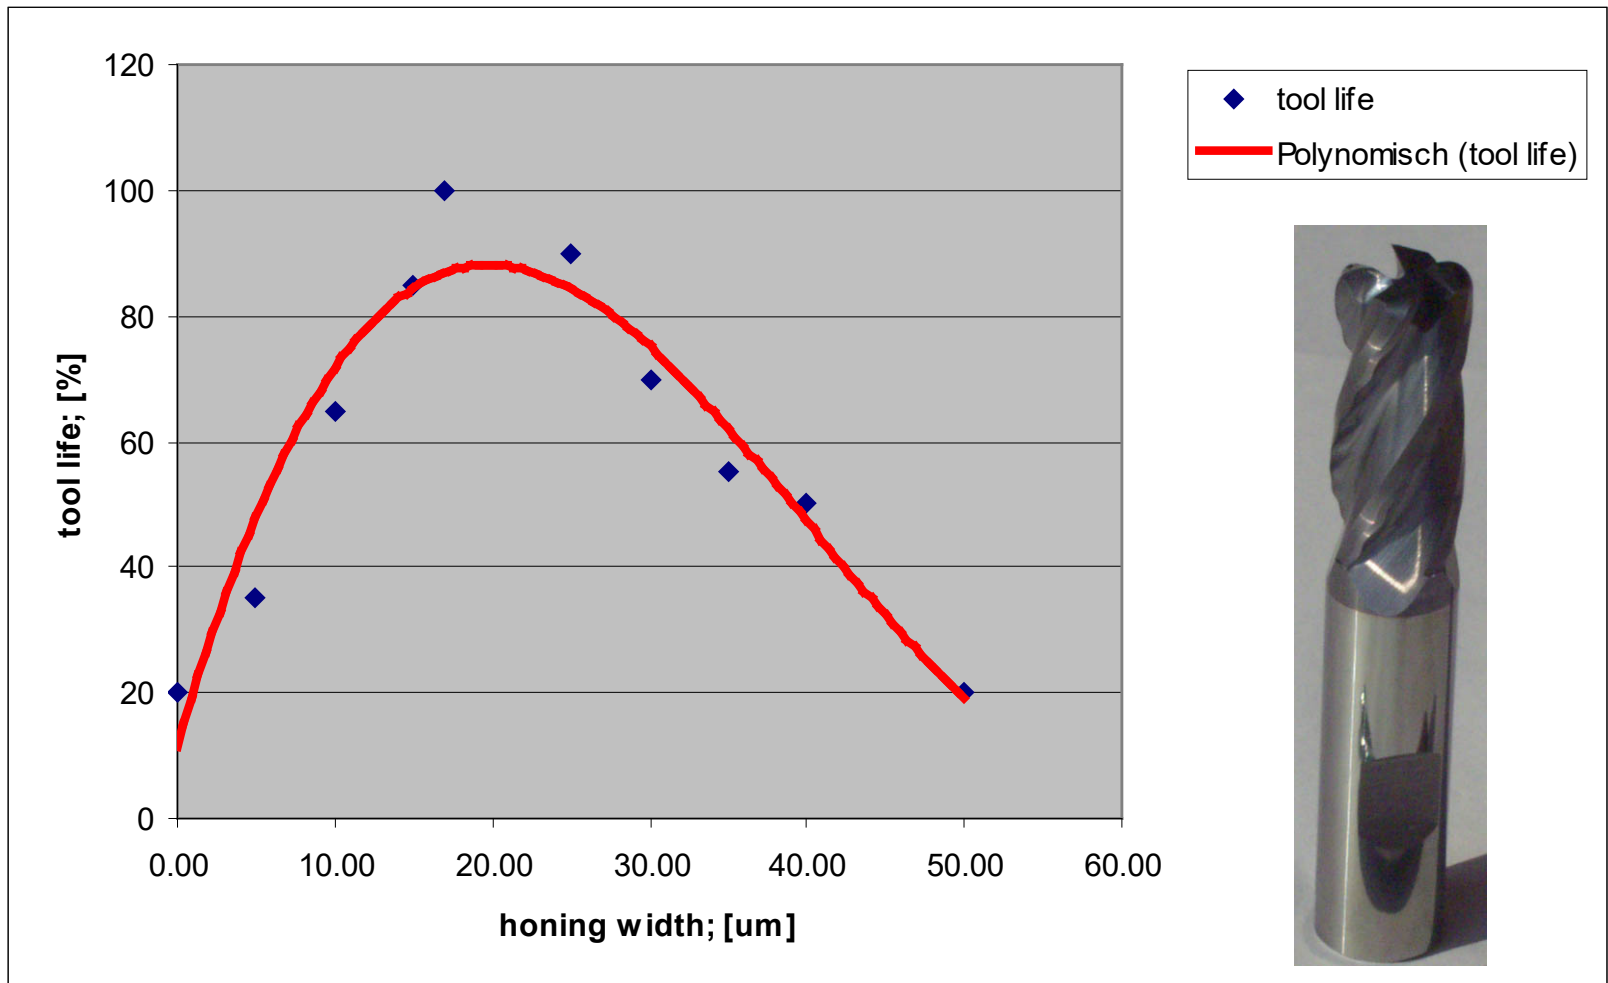

$t_B = : 3 \text{ min}:$

$$r_n = 30 \mu\text{m}$$

$$R_t = 1,3 \mu\text{m}$$

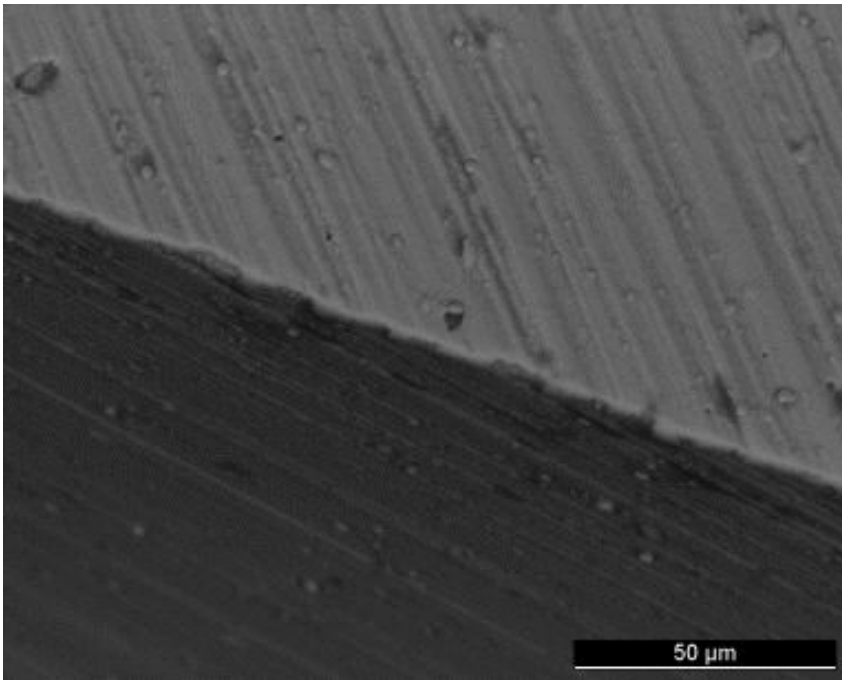

Influence of the Edge Preperation on Tool Life at High Performance Torus End Mill in **HIGH ALLOYED** Steel

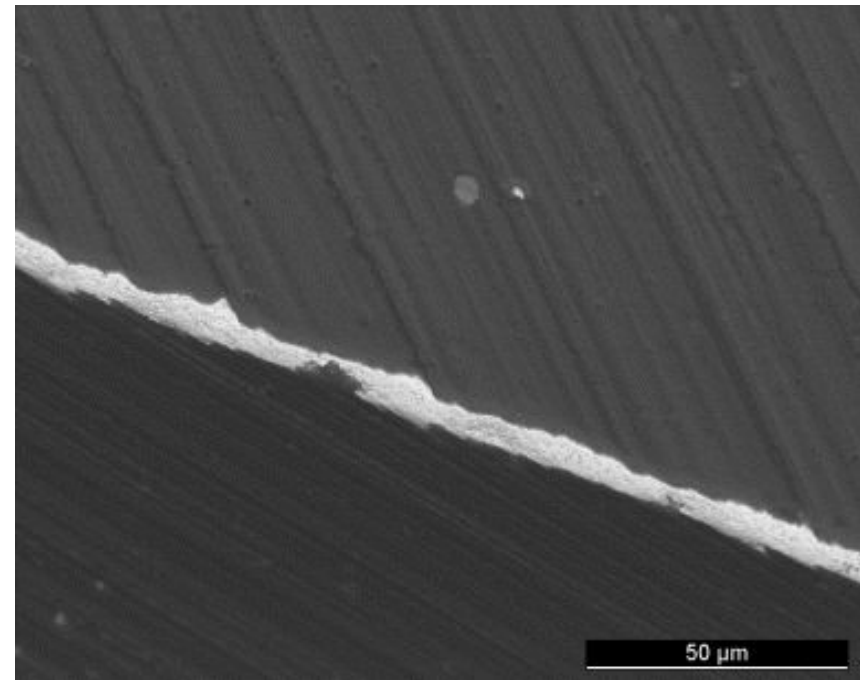

Influence of Edge Preparation on the Performance of Coated Cutting Tools

Edge Preparation after Coating

- The edges are rounded after coating
- The coating is moved away around the edge
- The edge is "set free"

The edge is covered by the coating after deposition

The edge is "set free" after coating mechanically

Influence of Edge Preparation on the Performance of Coated Cutting Tools

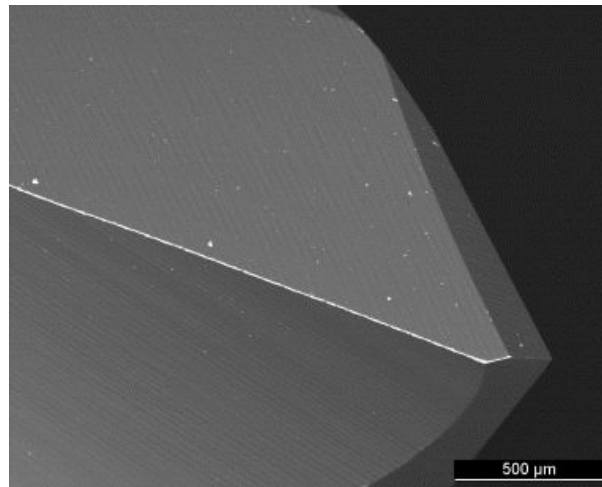

Advantages of
edge preparation after coating:

- Edge rounding &
- Droplet removing in one step
- Avoid big break outs

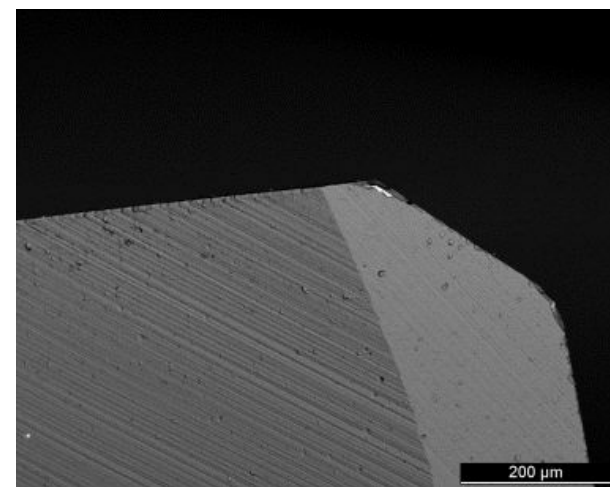

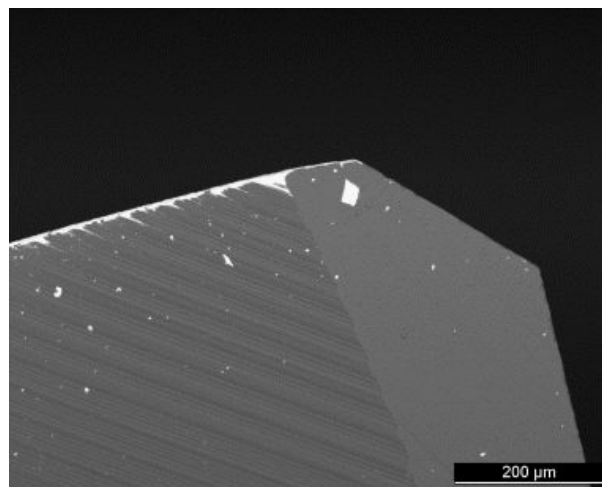

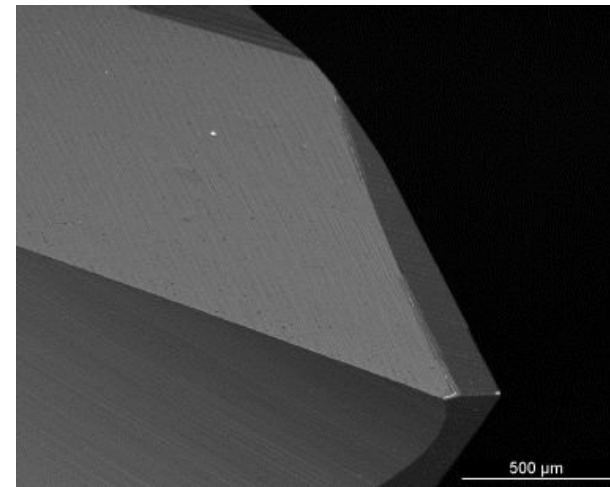

Disadvantages of
Edge Preparation after Coating:

- Interruption of coating structure on long surface line
- Full and direct contact of cutting and work piece material immediately
- Lower heat and chemical insulation
- Low coating thickness near to the edge
- Full coating structure begins far away from cutting edge
- Bigger edge radius (e.g. for roughing) results larger surfaces without coating
- Impression of bad coating

"Set free" edges

As coated

Influence of Edge Preparation on the Performance of Coated **Inserts**

APPLICATION 3

- Drilling
- Milling
- **Inserts for**
 - **Turning**
- Tapping
- Sawing

Target : **EDGE STABILITY**

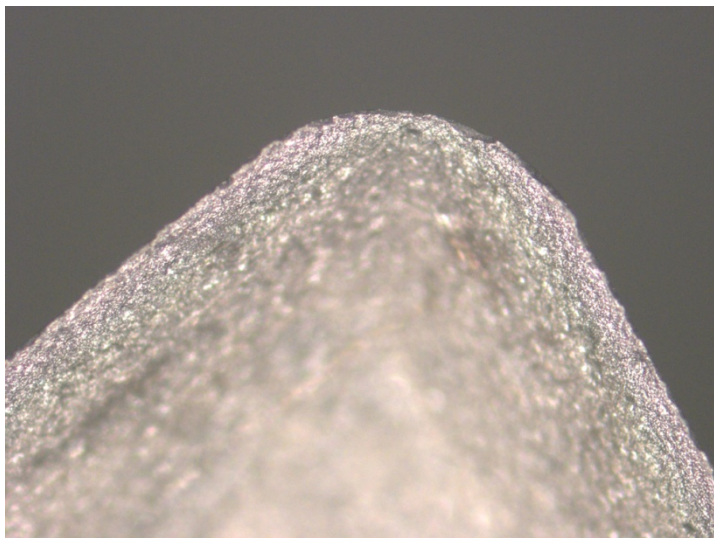

- **Form**
- **Surface**
- **Cutting material**

TREATMENTS

- Grinding
- Brushing
- **Micro Blasting**
 - **Dry**
 - **Wet**
- **Drag Grinding**
- Magnet Finishing

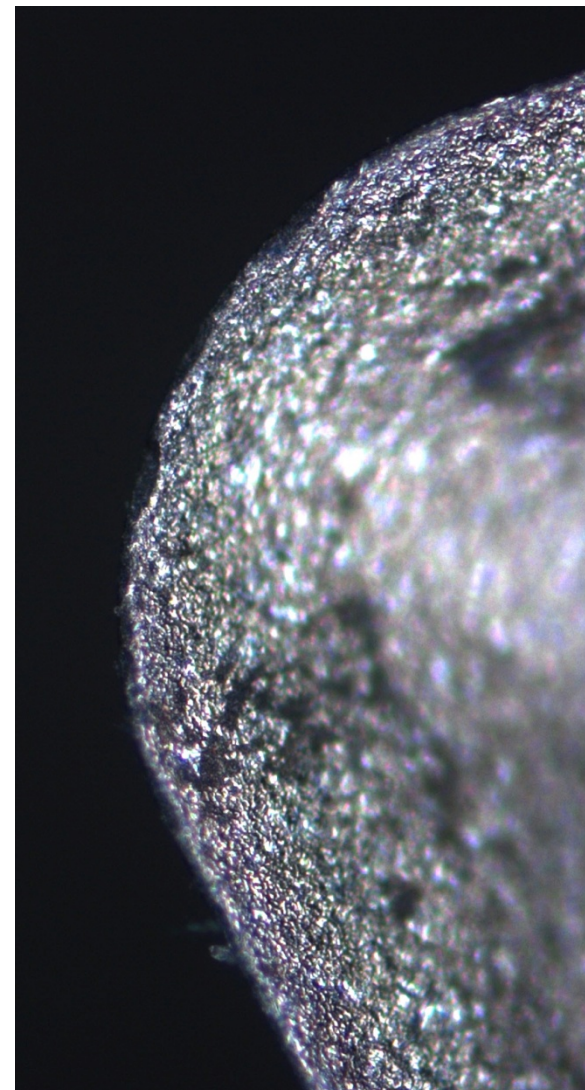

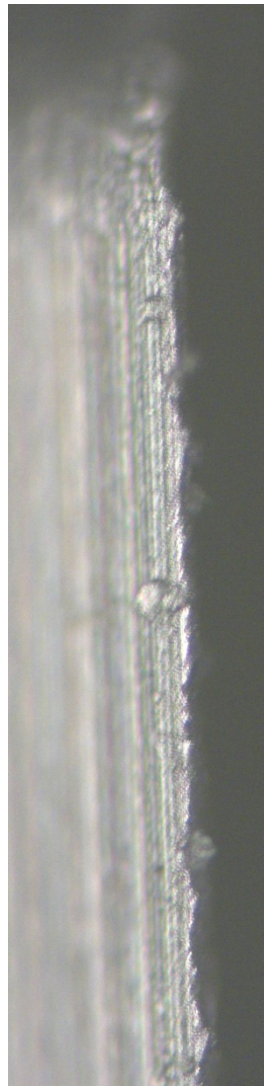

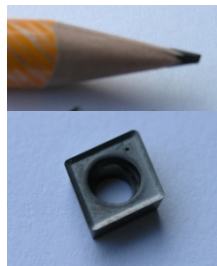

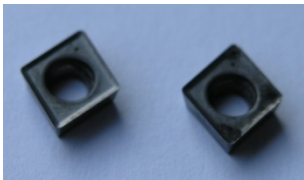

Influence of Edge Preparation on the Performance of Coated Inserts

Turning inserts from the
production:

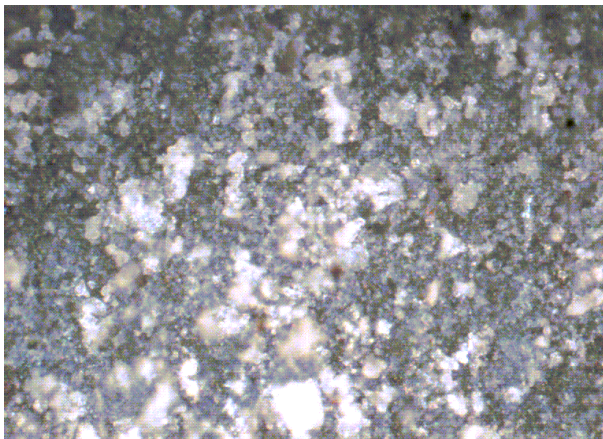

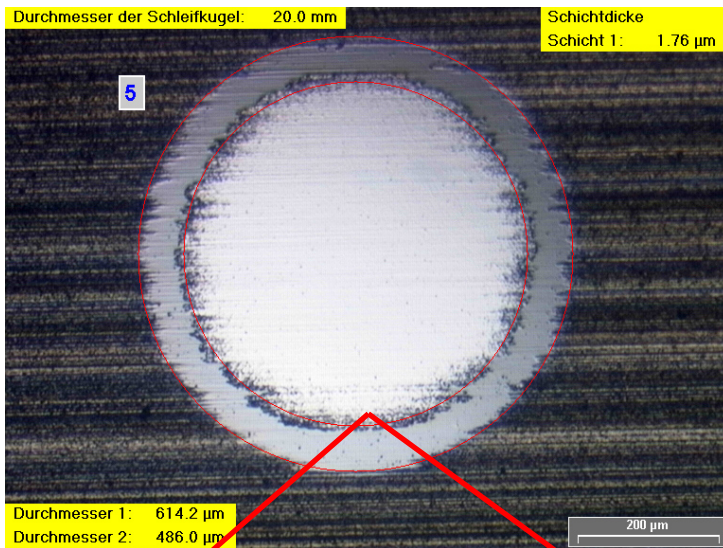

- top; sintered (Co-riched)
- side; ground (Co-leached)
- blasting is a MUST!

How Much Cobalt Leaching Can Be Accepted?

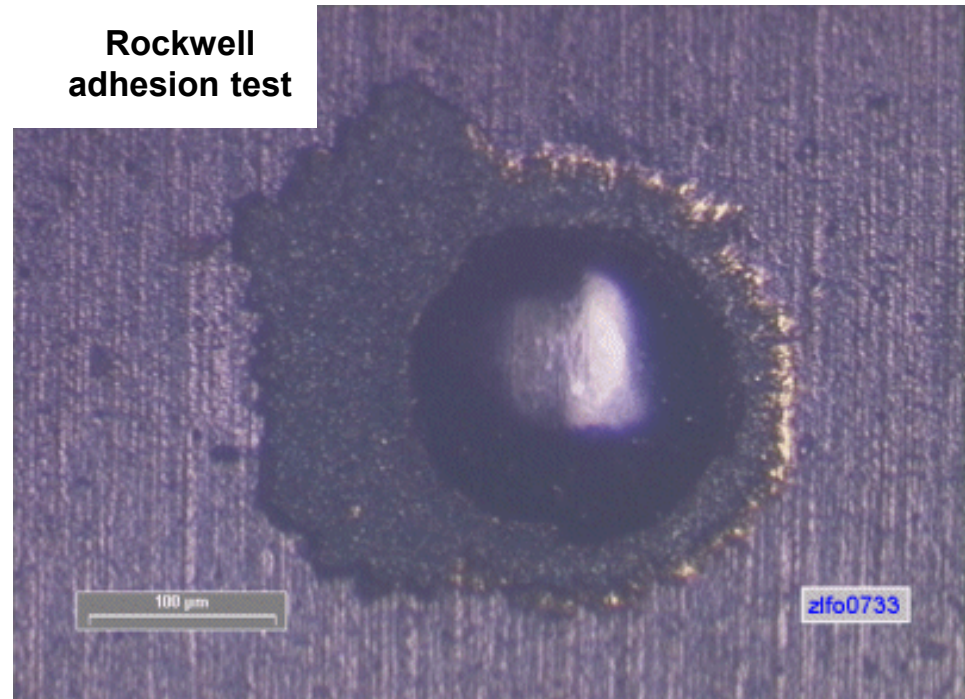

WHY Cobalt Leaching?

- grinding with critical emulsion coolant
- grinding at too high parameters
- grinding with blunt grinding wheels
- non correct stripping

Cobalt leaching

Rockwell
adhesion test

Coating on cobalt leached surface

- > coating on WC layer without/with few binder (cobalt)
- > very bad adhesion

How Much Cobalt Leaching Can Be Accepted?

Evaluation by the Rockwell test
from Mercedes Benz:
Characterization the goodness of
coating adhesion
by HF classes

Crack pattern

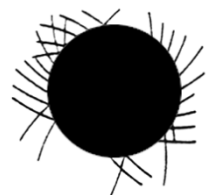

Flaking (*Substrate exposed*)

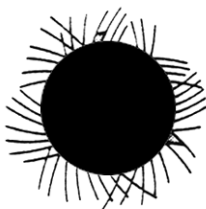

TEST PARAMETERS

Substrate Hardness:	54 HRc minimum
Coating Thickness:	5 μm maximum
Indentation:	Rockwell C
Visual Magnification:	100x

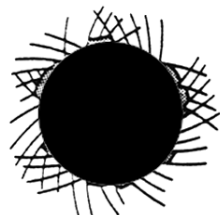

Good adhesion:

HF1

HF2

HF3

Deviant adhesion:

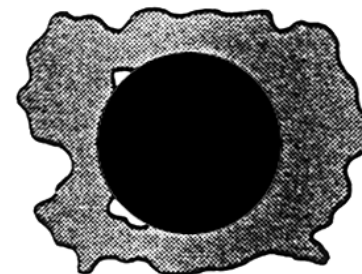

HF4

Bad adhesion:

HF5

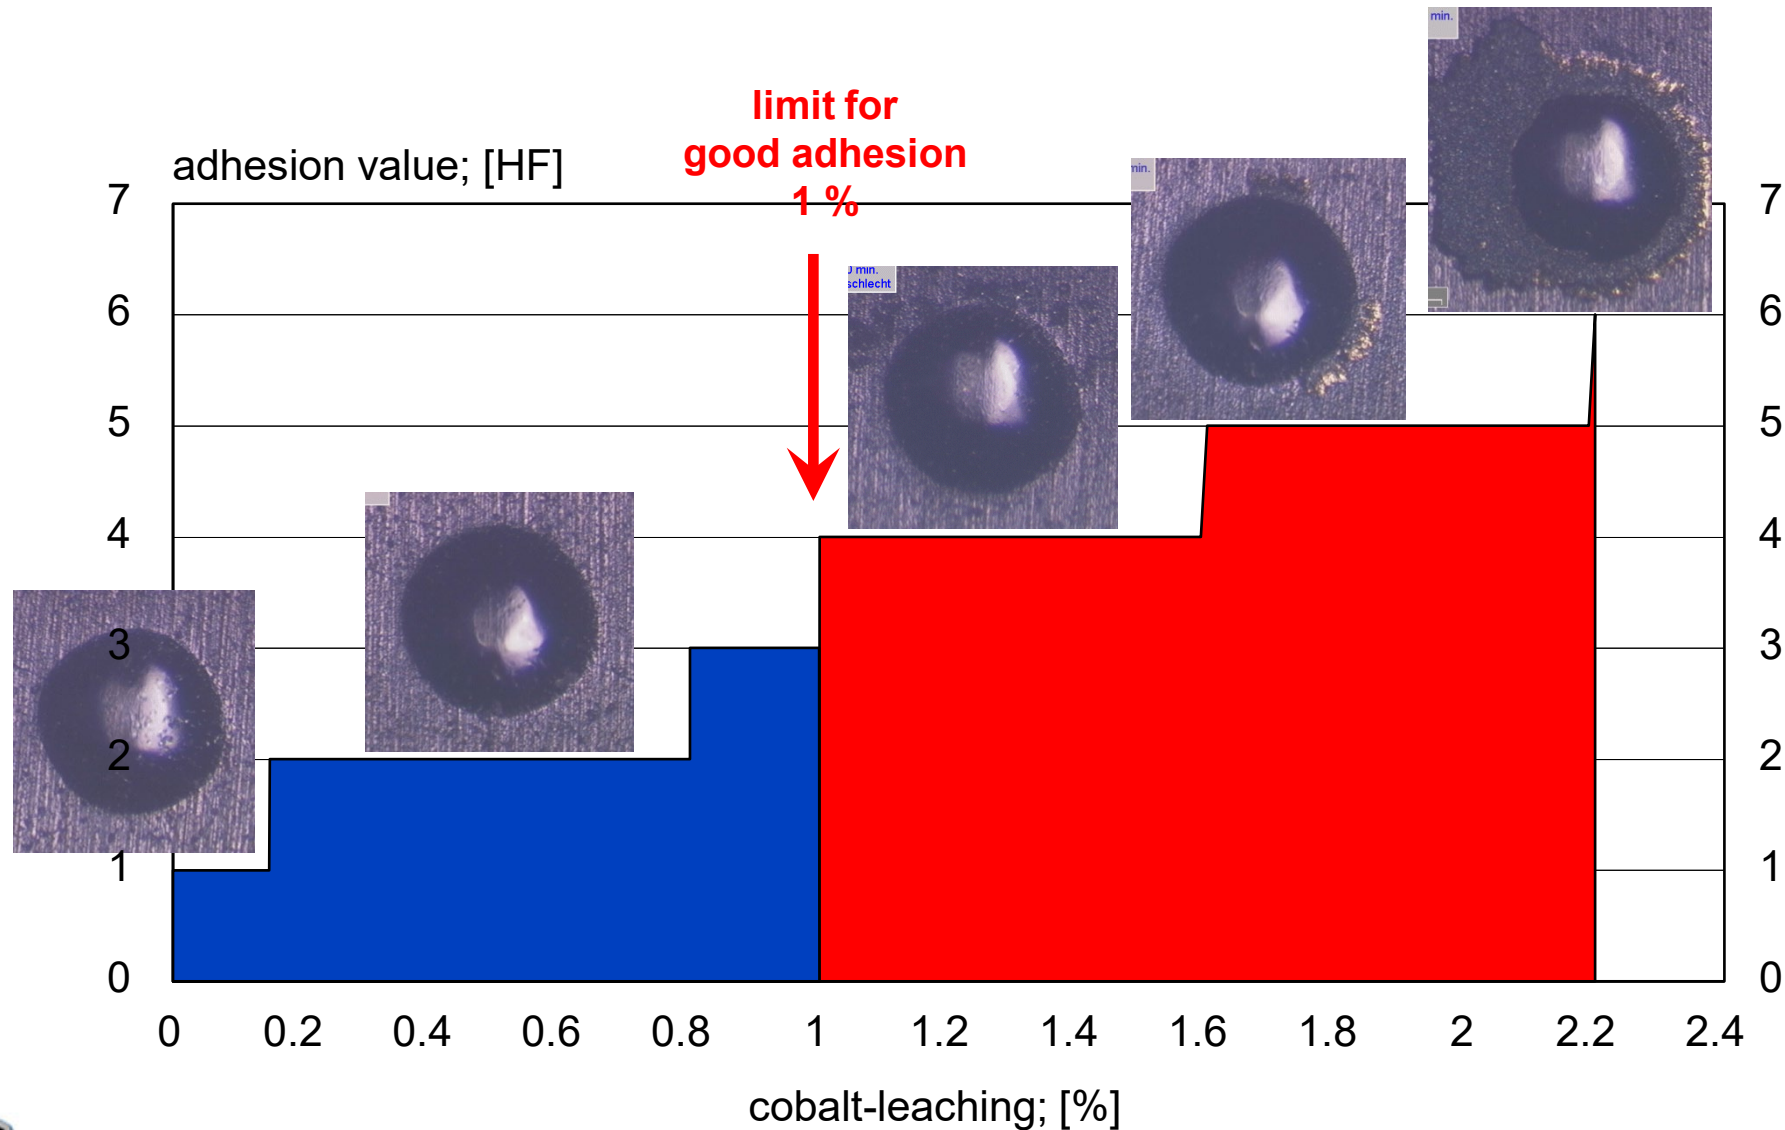

HF6

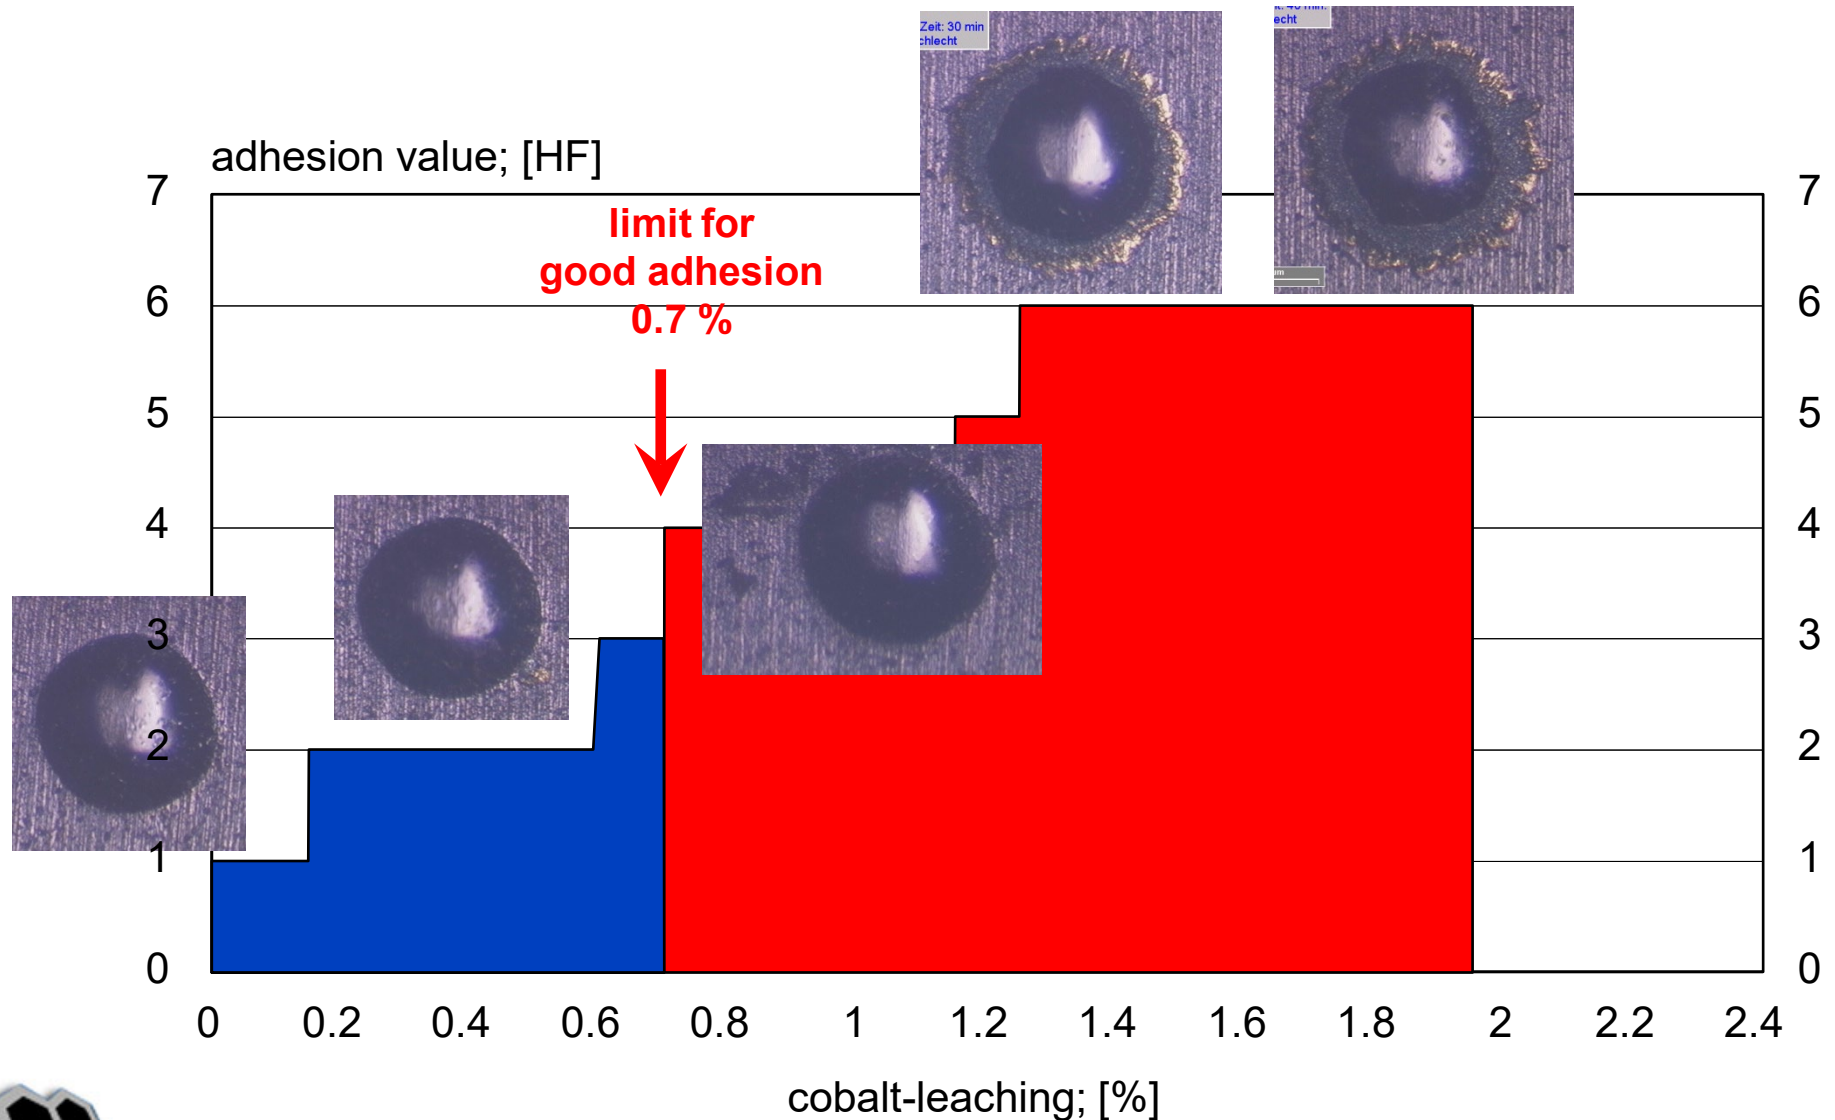

How Much Cobalt Leaching Can Be Accepted?

For good coating adhesion on K30/40 carbide with 10% cobalt

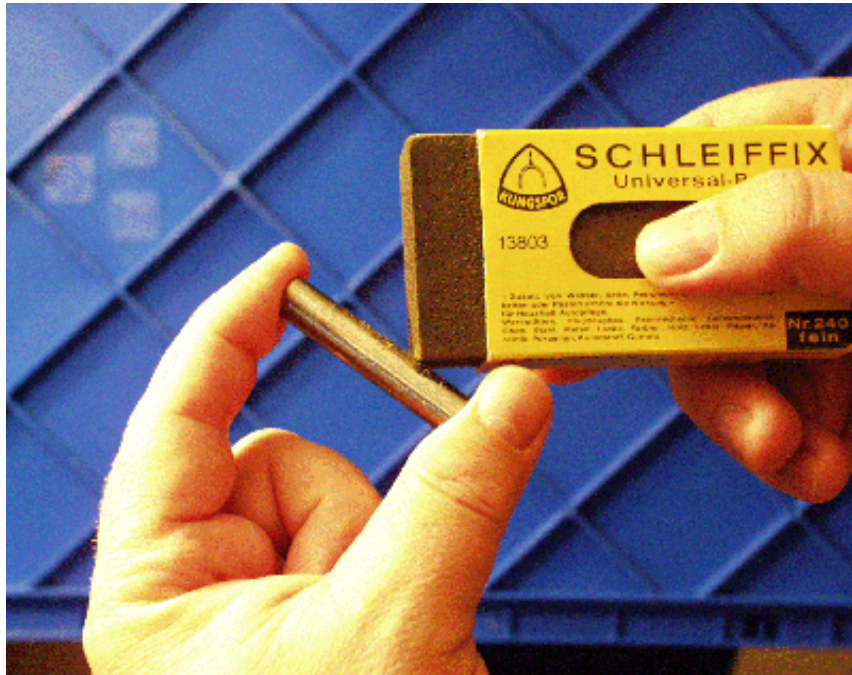

How Much Cobalt Leaching Can Be Accepted?

For good coating adhesion on K10 carbide with 6% cobalt

How to Check Cobalt-Leaching on Carbide?

Rubber Test on Carbide

Check the carbide surface under 100x magnification

Cobalt-Leaching

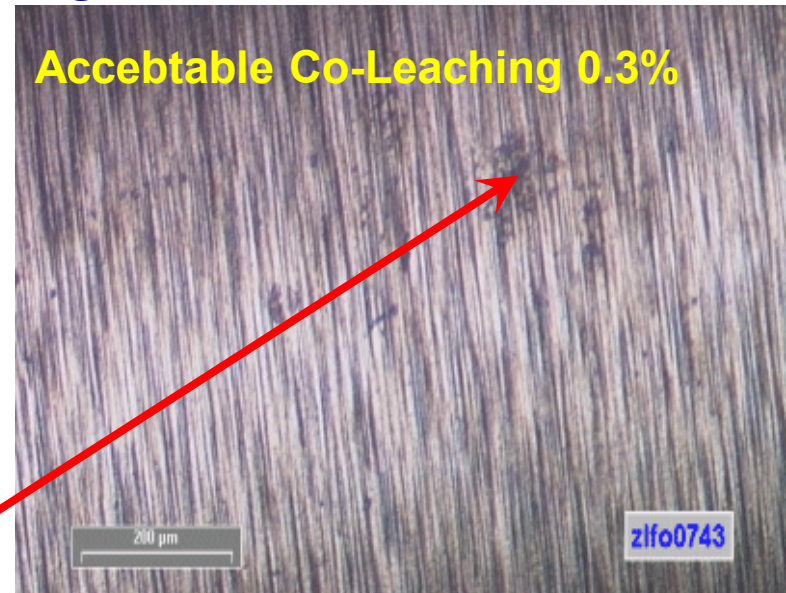

How to Check Cobalt-Leaching on Carbide?

No Co-Leaching

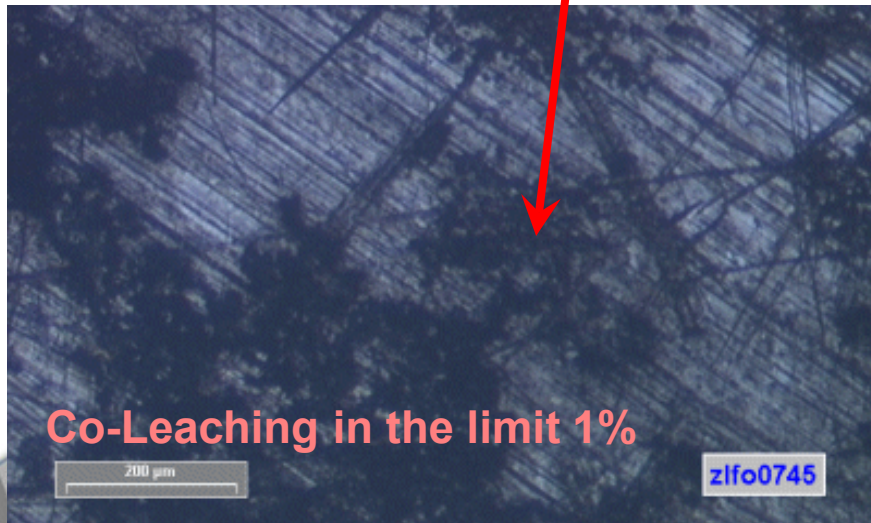

Acceptable Co-Leaching 0.3%

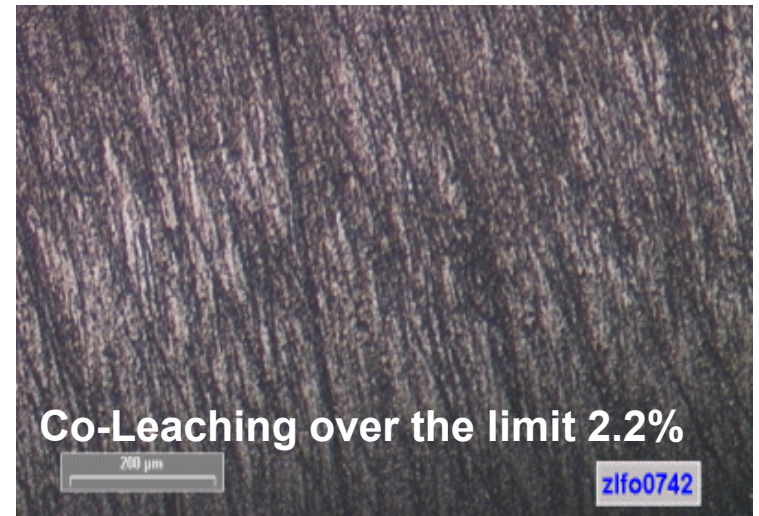

Cobalt-Leaching showed by rubbering
on K40 carbide with 10% Cobalt

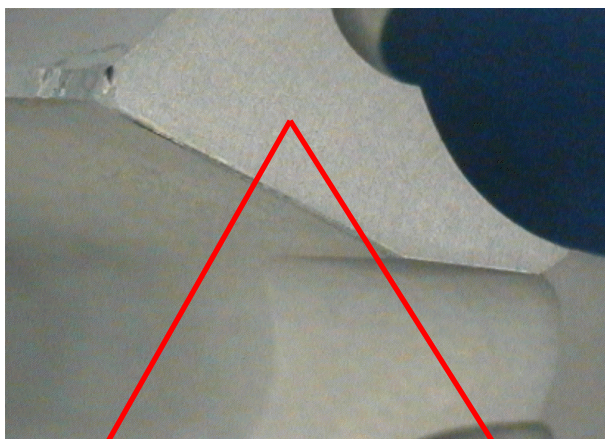

Co-Leaching in the limit 1%

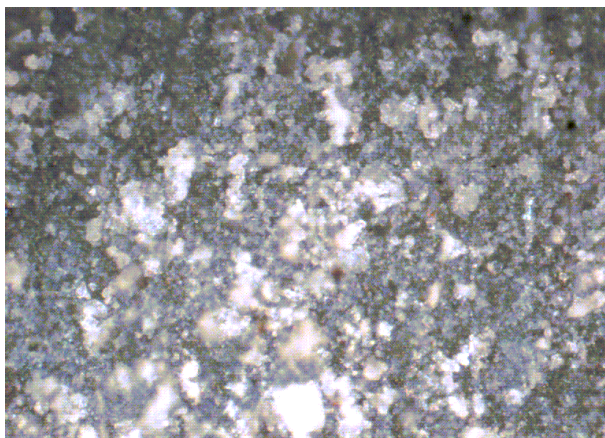

Co-Leaching over the limit 2.2%

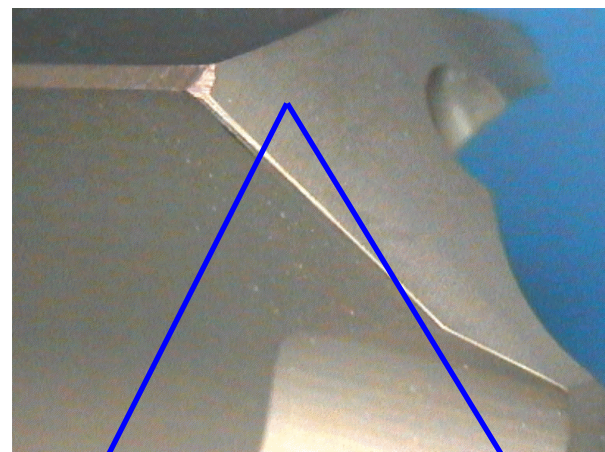

Improvement of the Surface Density and Coatability by Micro Blasting

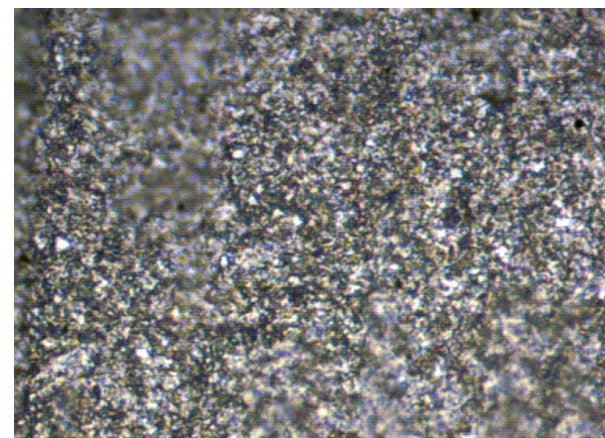

500x

Tool surface
with cobalt-leaching

500x

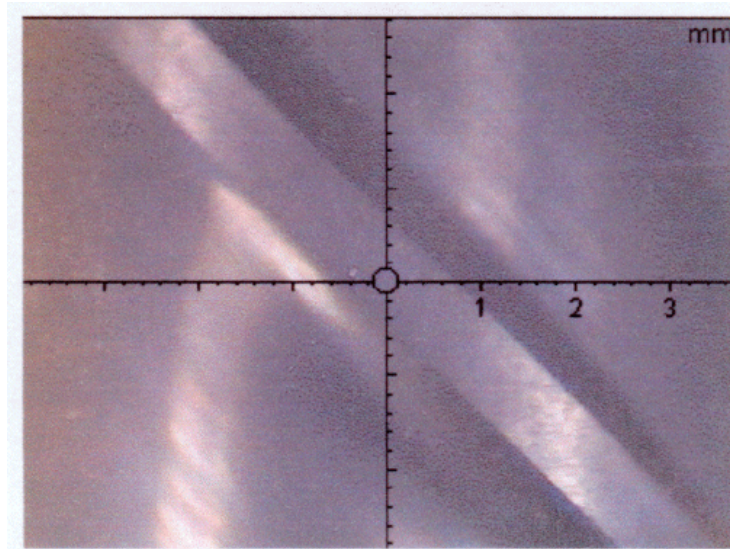

Tool surface after micro blasting
Without cobalt-leaching

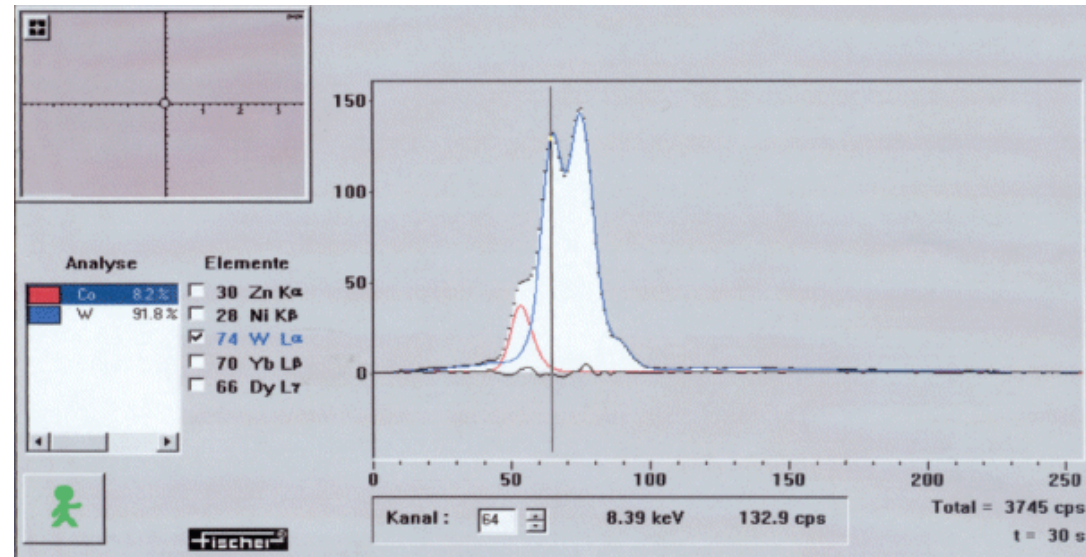

Improvement of the Surface Density and Coatability by Micro Blasting

Measuring Cobalt Leaching by X-Ray

Focusing
on the margin of the tool

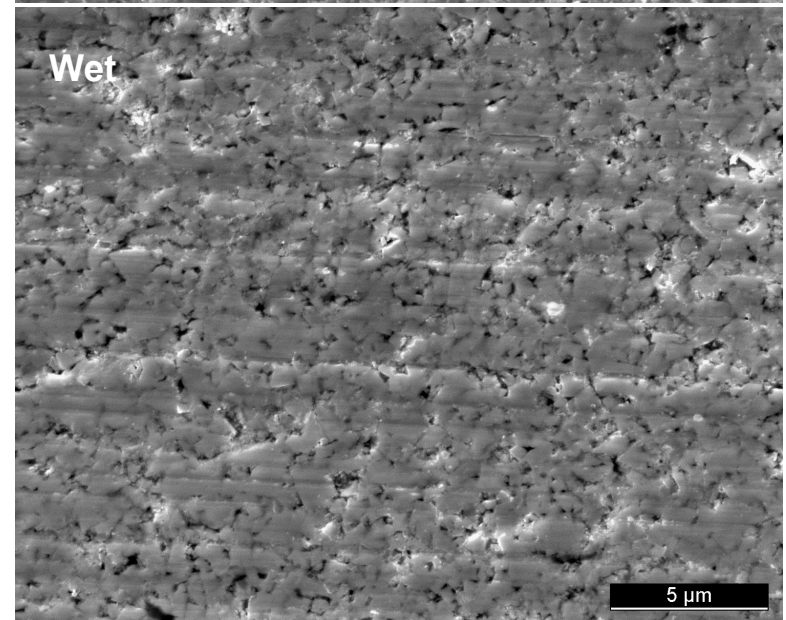

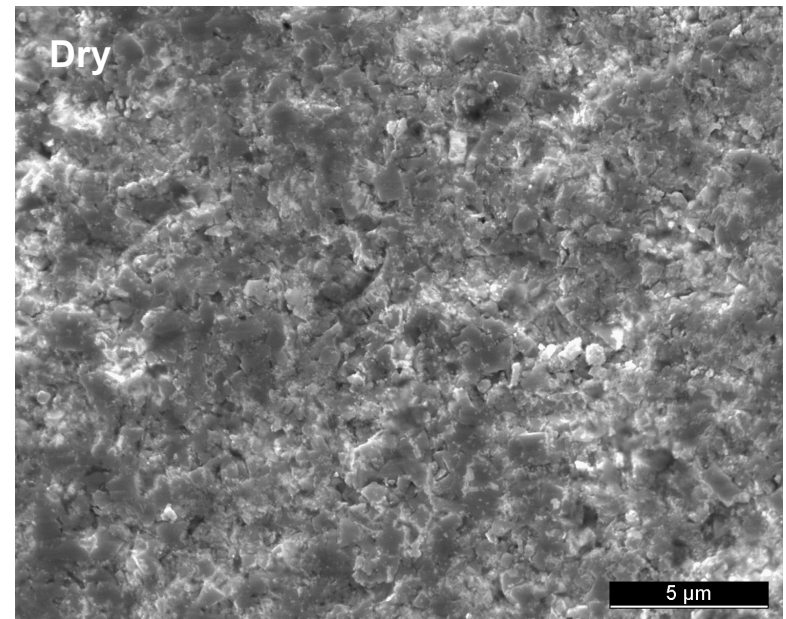

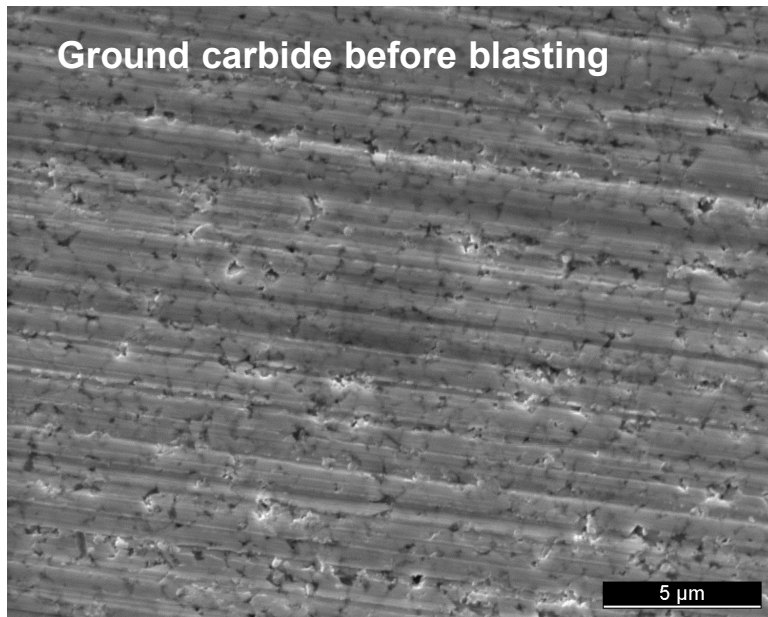

Spectrum with Co and W

Improvement of the Surface Density and Coatability by Micro Blasting

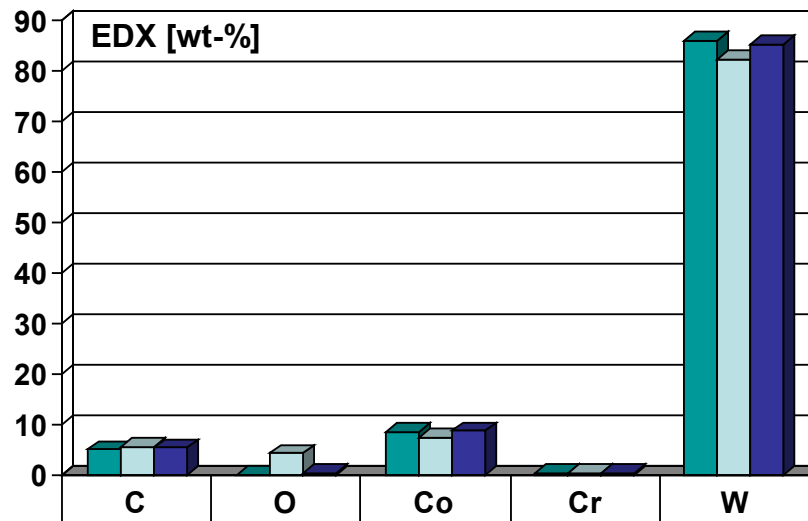

Dry or Wet by Micro Blasting? Comparison of Achievable Surface Structure

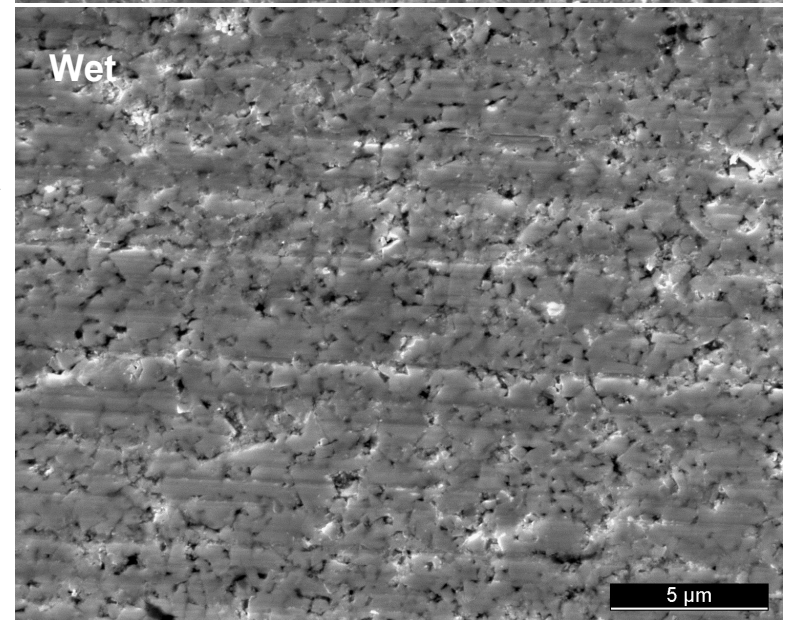

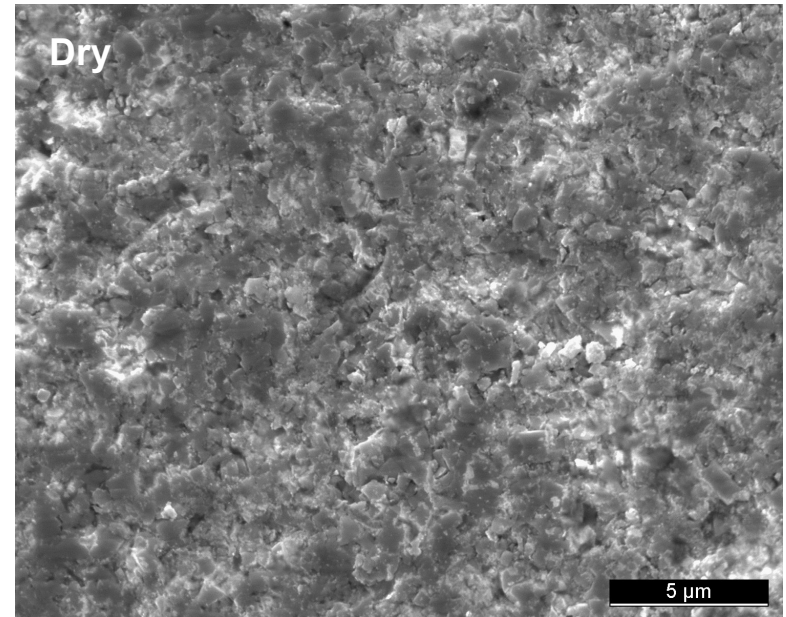

Improvement of the Surface Density and Coatability by Micro Blasting

Dry or Wet by Micro Blasting? Comparison of Achievable Surface Structure

Ground carbide Dry Wet

	C	O	Co	Cr	W
Ground carbide	5.1	0	8.6	0.4	85.9
Dry	5.7	4.3	7.5	0.4	82.1
Wet	5.4	0.4	8.7	0.4	85.1

Improvement of the Surface Density and Coatability by Micro Blasting

Dry or Wet by Micro Blasting? Comparison of Achievable Surface Roughness (AFM)

Improvement of the Surface Density and Coatability by Micro Blasting

Dry or Wet by Micro Blasting?

Comparison Example: Al ₂ O ₃ , 2 bar 320Mesh, 44 um grain size	DRY	WET
Surface roughness Example: 2 bar 320Mesh, 44 um grain size	Sa=0.11 um Sz=1.14 um	Sa=0.05 um Sz=0.32 um
Rest material after blasting	Smearing of residual material	Danger of cobalt leaching because of water
Coating adhesion	HF1	HF1
Edge rounding	"Filling" required	Better to control
Main features	<ul style="list-style-type: none"> - No drying needed after blasting - Easy handling at interrupted work - Lower price 	<ul style="list-style-type: none"> - Drying after blasting needed - Difficult cleaning at interrupted work - Higher price

Influence of Edge Preparation on the Performance of Coated Inserts

Drag Finishing in Polishing Machine by Special Powder

Before

After blasting with Alox and polishing by drag finishing

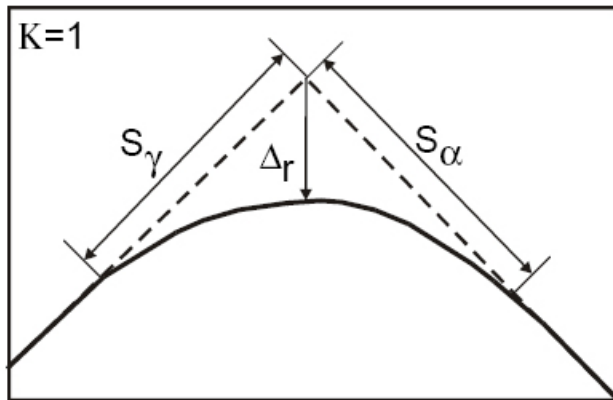

Influence of Edge Preparation on the Performance of Coated Inserts

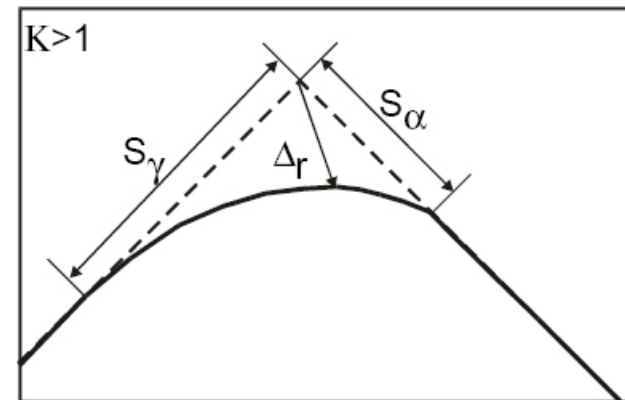

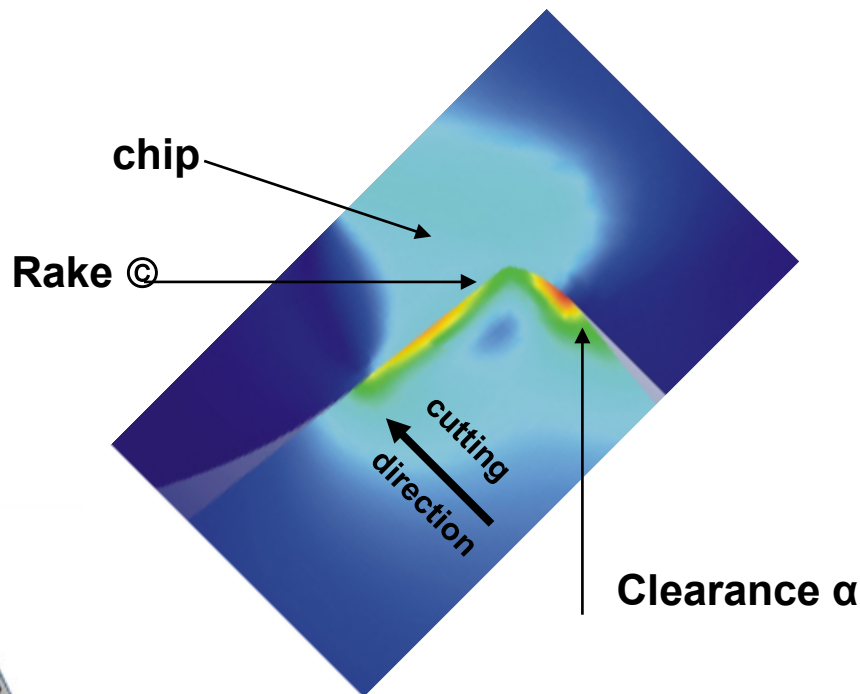

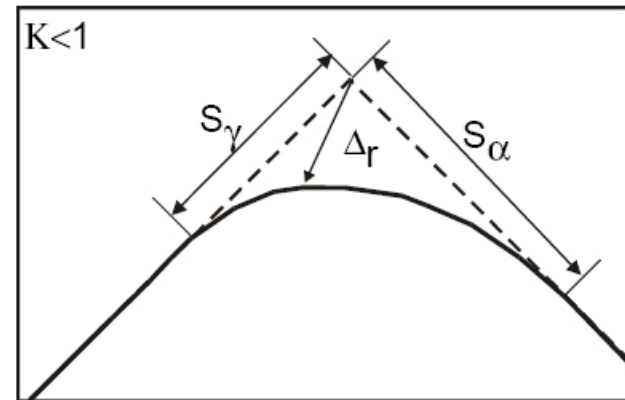

Work piece material: sintered PM steel - $R_m=1000 \text{ N/mm}^2$ – Insert: CPGT 05T104 FN20 DS10
 $vc=200 \text{ mm/min}$ – $f=0.11-0.13 \text{ mm/rev}$ – $ap=0.6 \text{ mm}$ – Source: Deni, Switzerland

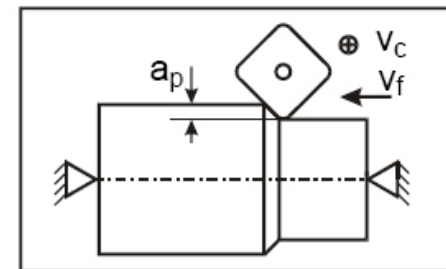

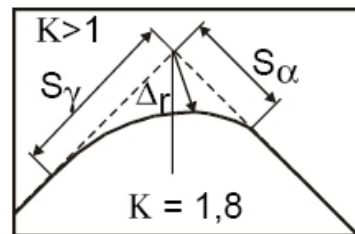

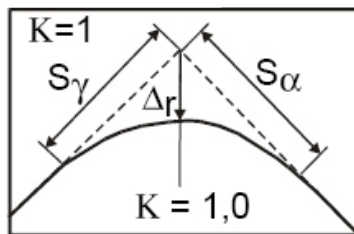

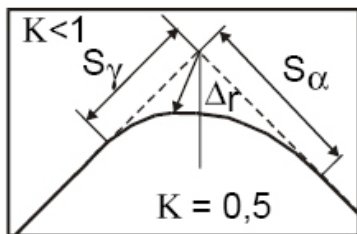

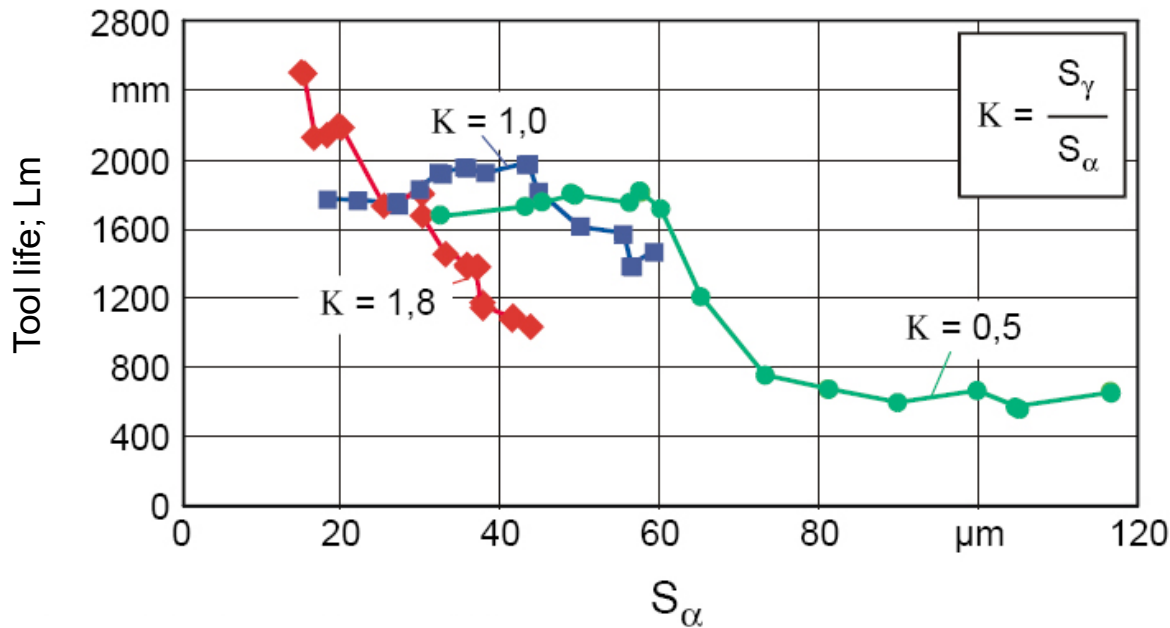

Influence of Prepared Edge Shape on the Performance of Coated Inserts

$$K = \frac{S_\gamma}{S_\alpha}$$

Influence of Edge Preparation on the Performance of Coated Inserts

Source: iwf University Hannover, Germany - Material: carbon steel - Ck45N - dry
HM insert: SNGA 120408 – KMF – TiAlN – $v_c=200$ m/min – $f=0.25$ mm/rev – $a_p=1.5$ mm

Influence of Edge Preparation on the Performance of Coated **Taps**

APPLICATION 4

- Milling
- Drilling
- Turning
- **Tapping**
- Sawing

Target : **EDGE
STABILITY**

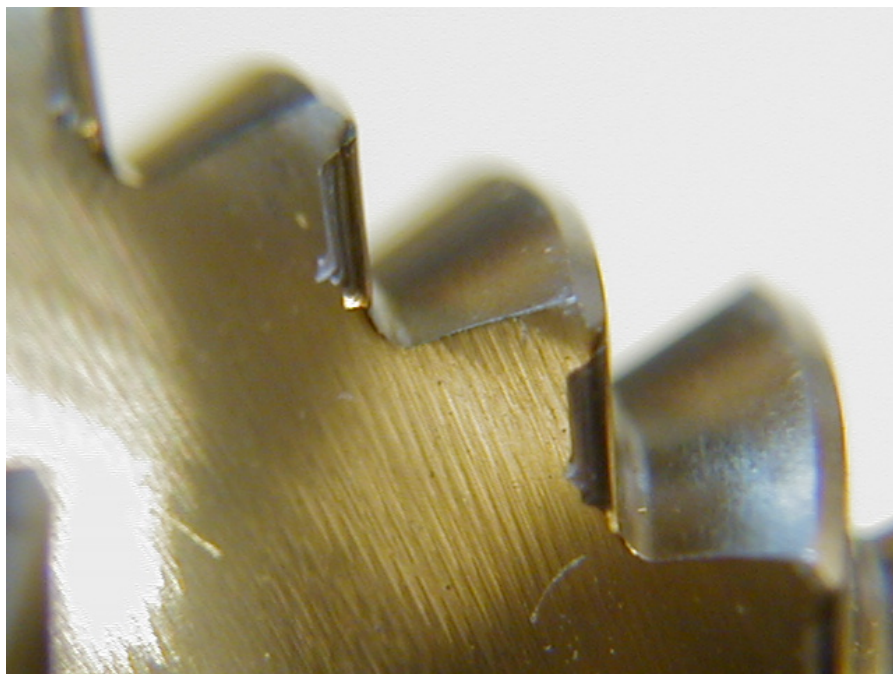

- **Form**
- **Surface**
- Metallurgy

TREATMENTS

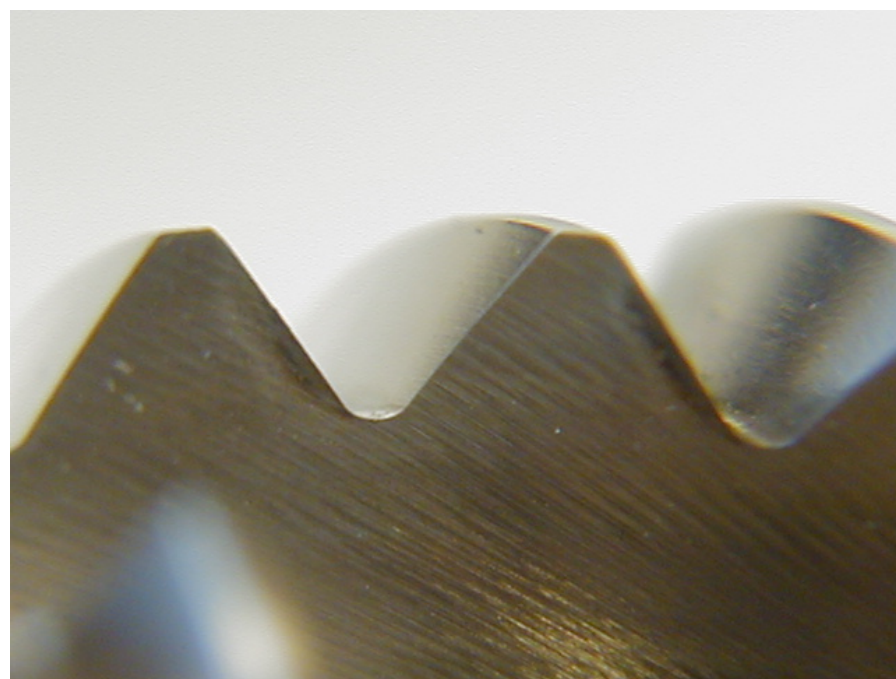

- Grinding
- Brushing
- Micro Blasting
 - Dry
 - Wet
- Drag Grinding
- **Magnet Finishing**

Influence of Edge Preparation on the Performance of Coated **Taps**

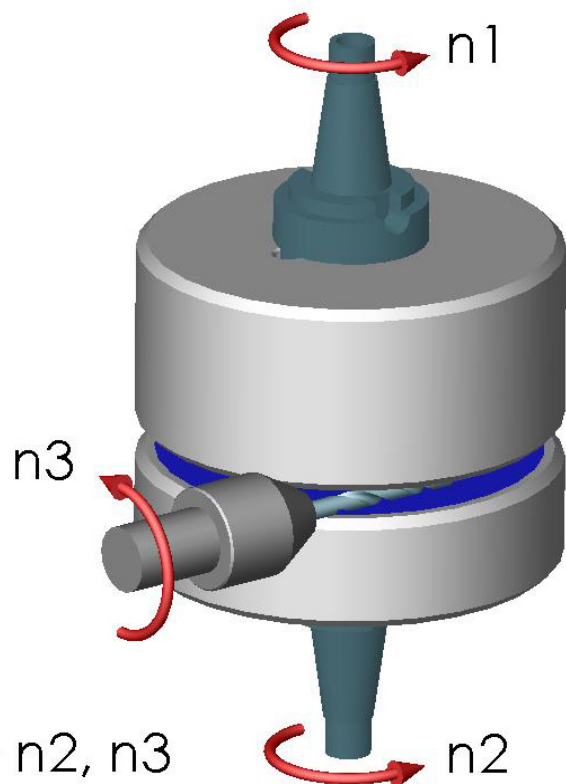

Without polishing

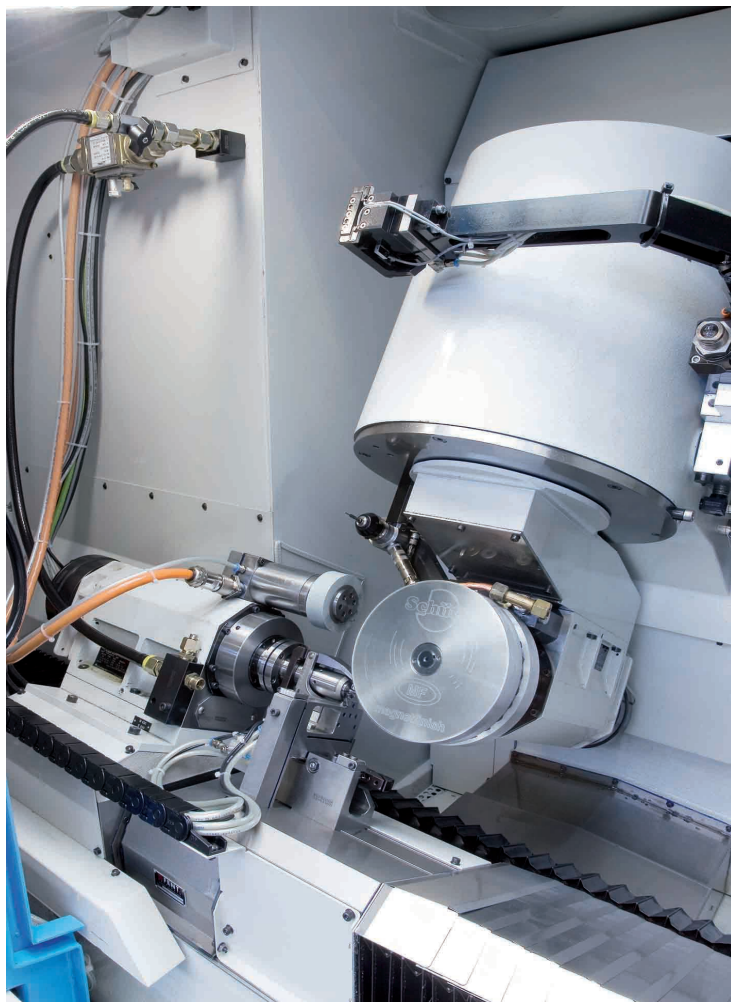

After polishing

Edge Preparation with Magnetic Powder with Robot Manipulation for Large Scale Tool Production

Edge Preparation of Small Tools (d>1mm) with Magnetic Powder Head as a "Grinding Wheel"

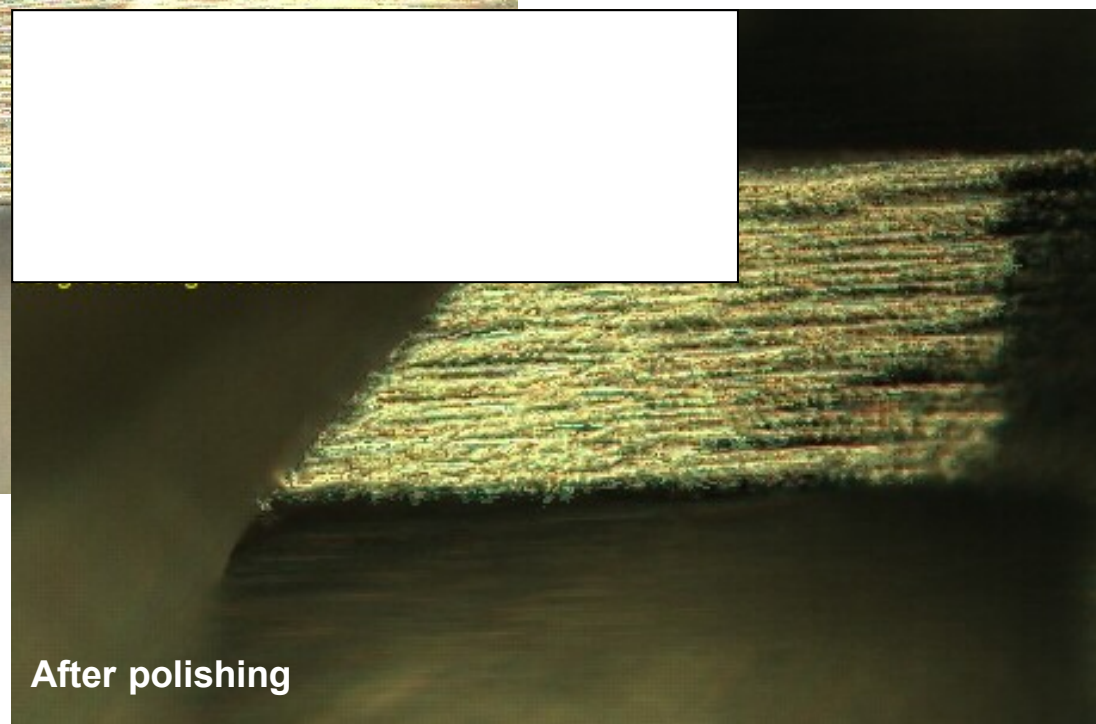

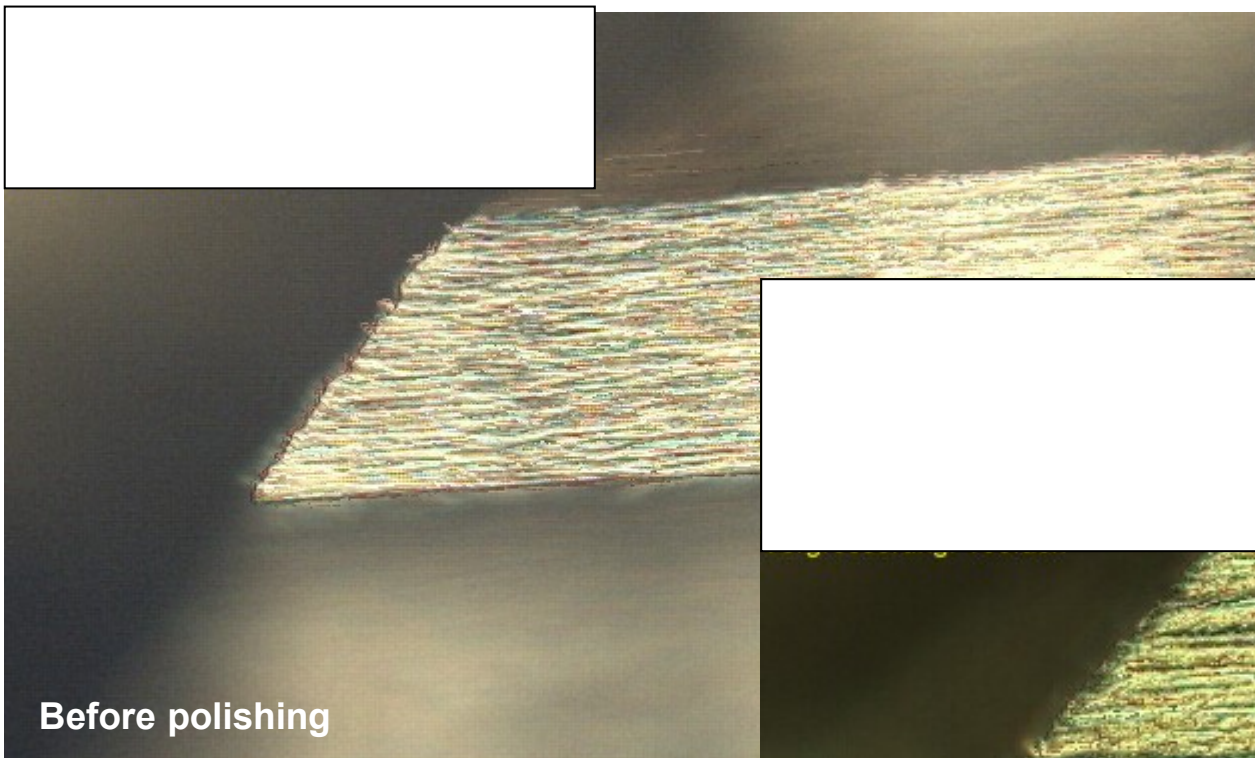

Source: MF & Schütte

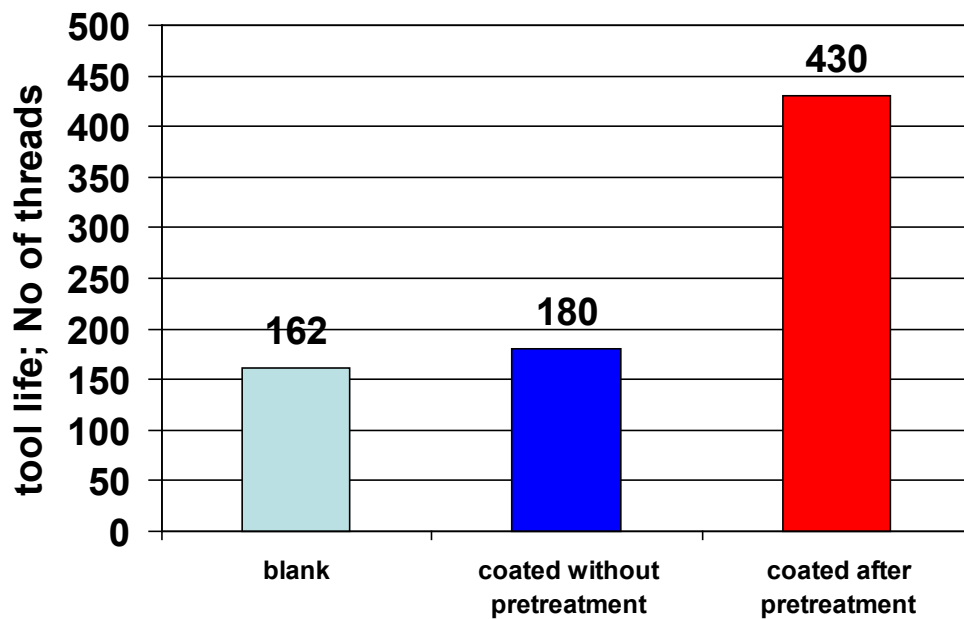

Influence of Edge Preparation on the Performance of Coated **Taps**

Magnification: 100x

Influence of Edge Preparation on the Performance of Coated Taps

Work piece Material: carbon steel - C45K – Coolant: emulsion 7%
Tools: rigid taps - M3 – $a=1.5x_d$ – blind holes - $vc=10$ m/min

Influence of Edge Preparation on the Performance of Coated **at Wood Cutting**

APPLICATION 5

- Drilling
- Milling
- Turning
- Tapping
- **Sawing**

Target : **EDGE STABILITY**

- **Form**
- Surface
- Metallurgy

TREATMENTS

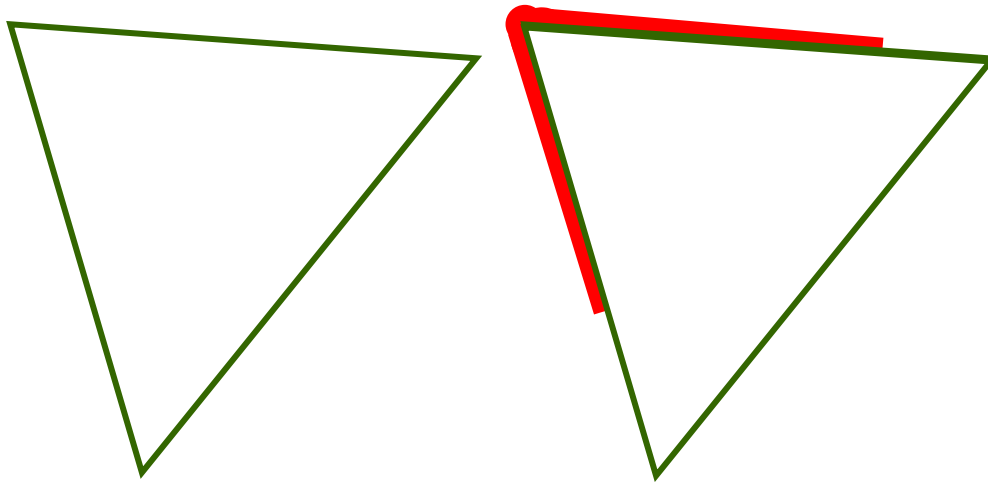

- **Grinding**
- **Brushing**
- Micro Blasting
 - Dry
 - Wet
- Drag Grinding
- Magnet Finishing

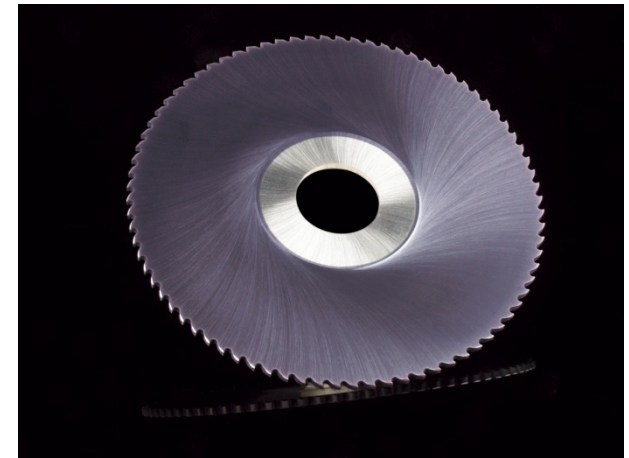

Influence of Edge Preparation on the Performance of Coated **at Wood Cutting**

**Expert's opinion:
The Cutting Edge Must Be Sharp! ?**

Therefore coating hardly used in wood cutting;

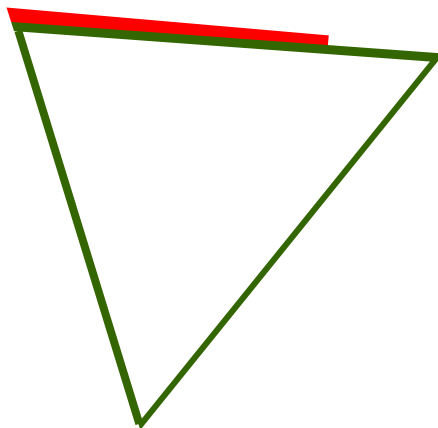

Only 2% wood cutting tools are coated!

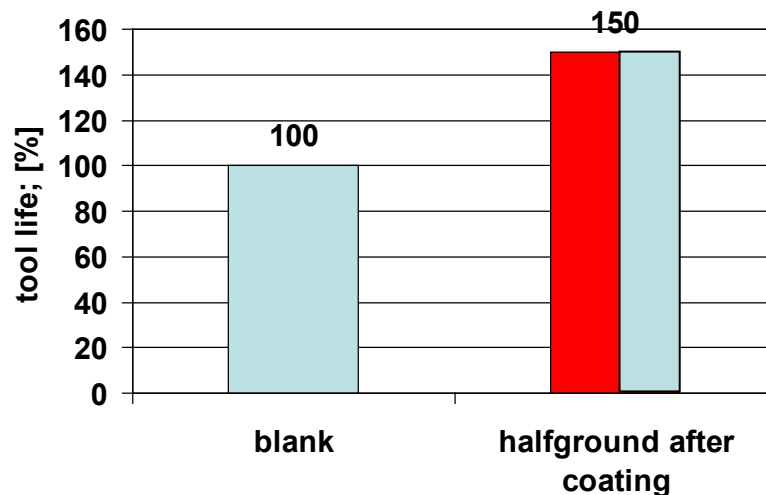

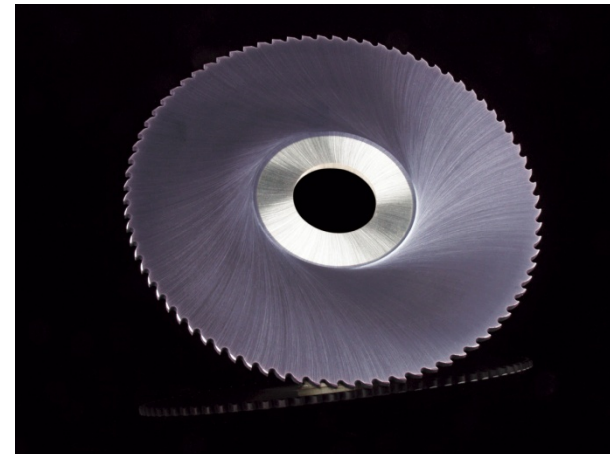

Influence of Edge Preparation on the Performance of Coated **at Wood Cutting**

**Expert's opinion:
The Cutting Edge Must Be Sharp! ?**

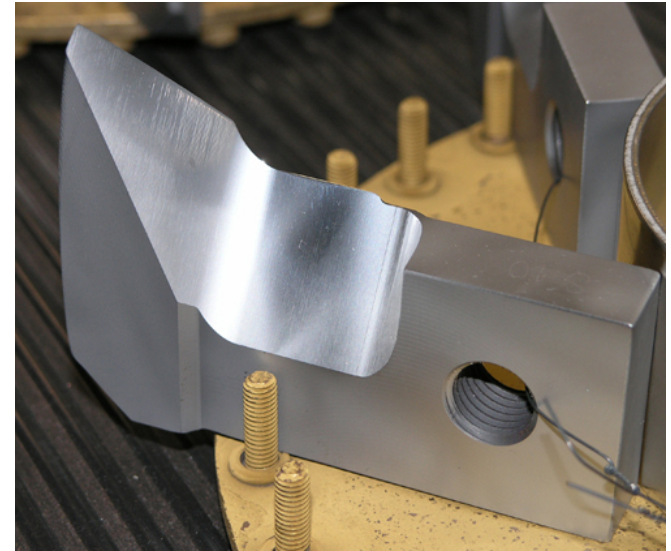

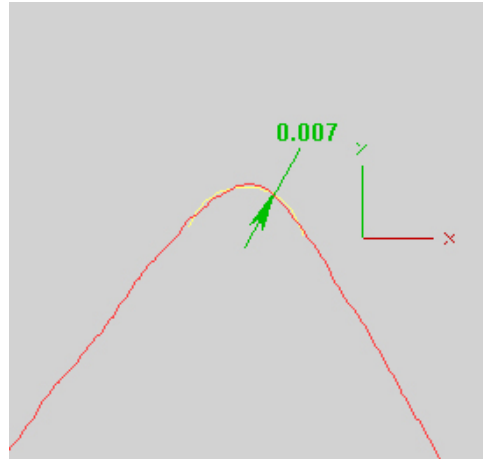

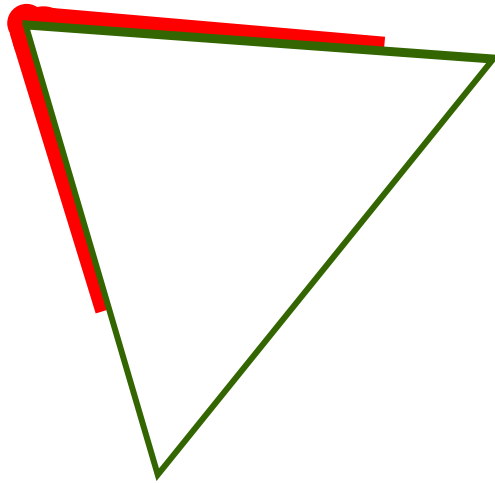

Therefore coating hardly used in wood cutting;
Only 2% wood cutting tools are coated!

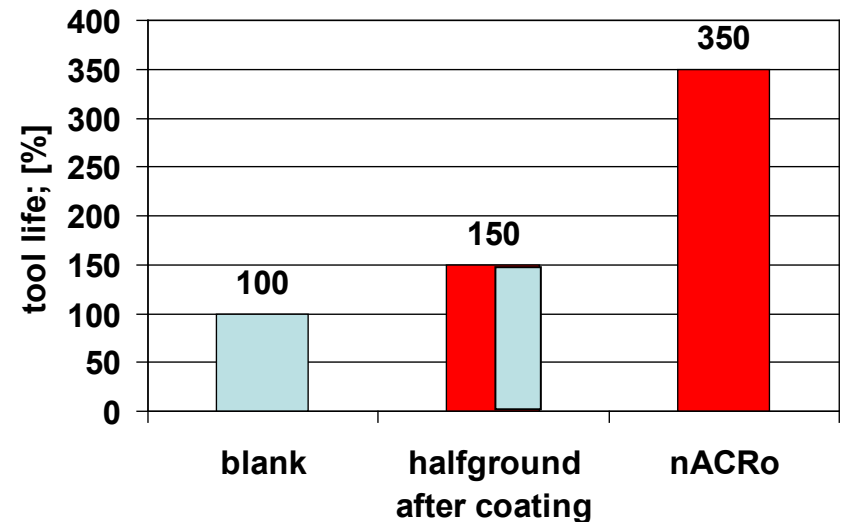

When coated the edge will be resharpened
immediately after coating
Performance increase is not impressing!

Influence of Edge Preparation on the Performance of Coated **at Wood Cutting**

Full coating after very fine edge rounding increases tool performance significantly even for WOOD CUTTERS

Influence of Edge Preparation on the Performance of Coated Cutting Tools

Summary: Comparison of Treatment's Features

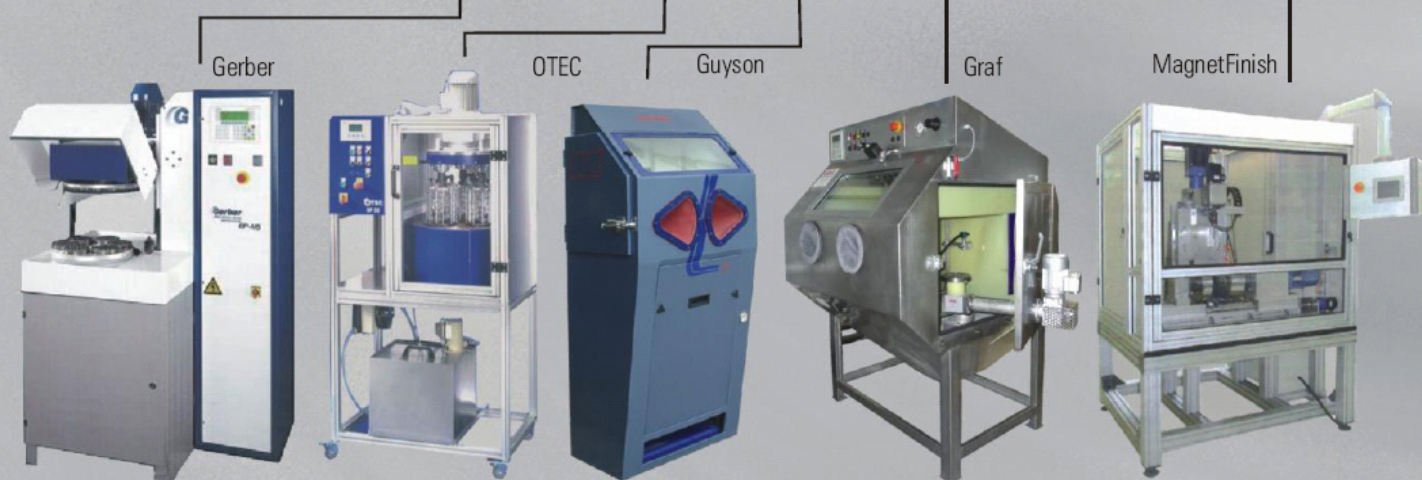

Treatment	Typical time / shank tool	Flexibility	Costs / Tool
Brushing	2 min / 6 = 20 sec	good	medium
Drag grinding	12 min / 24 = 30 sec	medium	medium to high
Dry blasting	20 sec	medium	medium
Wet blasting	10 sec.	medium to high	low
Magnet finishing	20 sec	medium	medium to high

Influence of Edge Preparation on the Performance of Coated Cutting Tools

Edge Treatment Methods

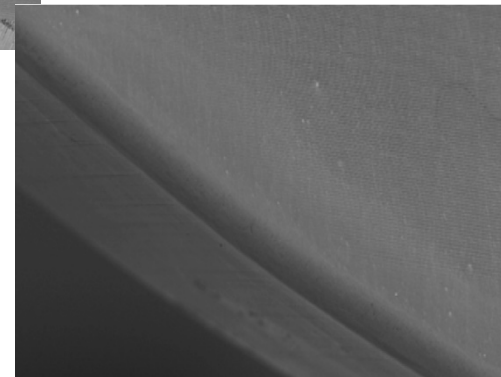

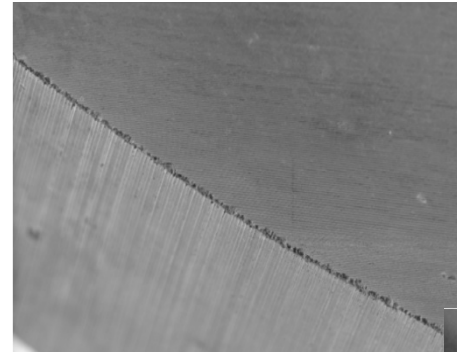

Criteria / Features	Honing by Hand with diamond file	Brushing	Drag Grinding (Polishing)	Micro Blasting Dry	Micro Blasting Wet	Water Beam	Magnet Finishing
Quality	++ best	+ good	+ good	○ medium	+ good	+ good	+ good
Constancy	depending on person	+ good	+ good	○ medium	+ good	+ good	+ good
Flexibility	↑↑ very high	↑ high	○ medium	○ medium	↑ high	○ medium	↑ high
Productivity	↓ low	○ medium	○ medium	○ medium	↑ high	++ very high	○ medium
Price	salary only	↑ high	○ medium	↓ low	○ medium	↑↑ very high	↑ high
Standard machines available		✓ yes	✓ yes	✓ yes	✓ yes		✓ yes
Flute polishing possible		✓ yes	✓ yes	✓ yes	✓ yes		○ limited in depth
Droplet removal possible		✓ yes	✓ yes	✓ yes	✓ yes		✓ yes
Special features	typical for small regrinders	commonly used for end mills, difficult for taps	droplet removal difficult for small diameters	residual materials on the surface	no residual mat. after blasting high air consumption	only for large scale production, corrosion protection needed	demagnetizing necessary

Influence of Edge Preparation on the Performance of Coated Cutting Tools

Summary

- Without edge preparation
 - low performance
- Different work piece materials to be cut
 - need different edge preparation
- Over the optimum edge preparation
 - performance drops down abruptly
- Optimum edge preparation
 - increases performance enormously
